#### Abstract

A set $S$ of edge-disjoint one-factors in a Graph $G$ is said to be maximal if there is no one-factor of $G$ which is edge-disjoint from $S$, and if the union of $S$ is not all of $G$. Maximal sets of one-factors of $K_{2 n}$ have been investigated and until very recently only results for particular cases have been obtained. In this paper we present a new technique for solving the problem.

## 1. INTRODUCTION

We consider graphs which are undirected, finite, loopless and have no multiple edges. For the most part our notation and terminology follows that of Bondy and Murty [1]. Thus $G$ is a graph with vertex set $V(G)$, edge set $E(G), \nu(G)$ vertices and $\varepsilon(G)$ edges. $K_{n}$ denotes the complete graph on $n$ vertices and $K_{n, m}$ denotes the complete bipartite graph with bipartitioning sets of size $n$ and $m$.

A 1-factor of a graph $G$ is a 1 -regular spanning subgraph. A 1-factorization of $G$ is a set of (pairwise) edge-disjoint one factors which between them contain each edge of $G$. It is very well known (see [3]) that $K_{2 n}$ and $K_{n, n}$ have 1-factorizations for all $n$.

A set $F$ of edge disjoint 1-factors in a graph $G$ is said to be maximal if there is no 1 -factor which is edge-disjoint from $F$ and if $F$
is not all of $G$. Thus if we write $\bar{F}$ for the complement in $G$ of the union of members of $F$, then $F$ is maximal if and only if $\bar{F}$ is a non-empty graph with no 1-factor. We call $\bar{F}$ the leave of $F$. Observe that if $G$ is regular, then $\bar{F}$ is regular. If $\bar{F}$ is d-regular, then $F$ is called a maximal set of deficiency d or simply a d-set. The existence of d-sets in $K_{2 n}$ for $n>2$ was shown by Cousins and Wallis [4].

Caccetta and Wallis [2] established that 3 -sets exist in $K_{2 n}$ for every $2 \mathrm{n} \geq 16$. This was accomplished by first establishing properties which reduced the problem to one of finding 3 -sets in $K_{2 n}$ for $16 \leq 2 n$ $\leq 28$, and then exhibiting the required 3 -sets. In this paper we generalize these methods. In particular, we prove that if $K_{2 n}$ has a d-set, then $K_{4 n-2 t}$ has a d-set for each $0 \leq t \leq n-\frac{1}{2}(d+1)$. We apply this result to show that 5 -sets exist in $K_{2 n}$ for every $2 n \geq 22$.

Recently, Rees and Wallis [6] solved the problem of determining the spectrum of maximal sets of 1 -factors in $K_{2 n}$. Our approach is, however, quite different and has the potential to yield a simpler and more intuitive proof. Our main result is of interest in its own right.

## 2. PRELIMINARIES

In this section we discuss three results which we make use of in the proof of our main theorem. A matching $M$ in a graph $G$ is a subset of $E(G)$ in which no $t$ wo edges have a common vertex. We begin by stating a lemma proved in Rees and Wallis [6].

Lemma 2.1. Let $K_{m, n}$ be the complete bipartite graph with bipartition $(X, Y)$, where $|X|=m,|Y|=n$ and $m \leq n$. Let $Y_{1}, Y_{2}, \ldots, Y_{n}$ be any collection of m-subsets of $Y$ such that each vertex $y \in Y$ is contained in exactly $m$ of the $Y_{j}$ 's. Then there is an edge-decomposition of $K_{m, n}$ into matchings $M_{1}, M_{2}, \ldots, M_{n}$ where for each $j=1,2, \ldots, n M_{j}$ is a matching with $m$ edges from $X$ to $Y_{j}$.

The edge-chromatic number $\chi^{\prime}(G)$ of a graph $G$ is the minimum
number of colours needed to colour the edges of $G$. Our next lemma is a special case of a theorem of Folkman and Fulkerson [5]. The proof we give was given to us in a personal communication by Rees.

Lemma 2.2. If $G$ is a graph with $c . k$ edges and $c \geq \chi^{\prime}(G)$, then the edge set of $G$ admits a decomposition into $c$ matchings, each with $k$ edges.
Proof: Let $\mathscr{C}$ be the set of all proper c-colourings of $G$. Note that $\mathscr{C}$ $\neq \phi$ since $c \geq \chi^{\prime}(G)$. For $K \in \mathscr{C}$, define

$$
n(K)=\sum_{i=1}^{c}\left|e_{i}-k\right|
$$

where $e_{i}$ is the number of edges in the $i^{\text {th }}$ matching (i.e. $i^{\text {th }}$ colour class) of $K, i=1,2, \ldots, c$.

Let

$$
n_{0}=\min \{n(K): K \in \mathscr{C}\},
$$

and let $K_{0}$ be a colouring for which $n\left(K_{0}\right)=n_{0}$. We will prove that $n_{0}$ $=0$, i.e. $K_{0}$ is a decomposition of $G$ into $c$ matchings, each with $k$ edges. Suppose that this is not the case and $n\left(K_{0}\right)>0$. Then there is a matching $M_{i}$ for which $e_{i}=\left|M_{i}\right|$ is not $k$. Now since $\varepsilon(G)=c k$, there must be matchings $M_{1}$ and $M_{2}$ say, with $e_{1}=\left|M_{1}\right|<k$ and $e_{2}=$ $\left|M_{2}\right|>k$.

Let $H$ be the subgraph of $G$ whose edge set is $M_{1} \cup M_{2}$. Then $H$ is the disjoint union of cycles and paths. Since $e_{2}>e_{1}, H$ must contain as a component a path $P$ of odd length which begins and ends with an edge of $\mathrm{M}_{2}$. Now switch the colours in $P$, i.e. those edges of $P$ that were coloured 1 get coloured 2 and vice-versa. Let us call the matchings corresponding to these colour changes $M_{1}$ ' and $M_{2}{ }^{\prime}$. This creates a new colouring $K_{o}^{\prime}$ of $G$ with corresponding matchings $M_{1}{ }^{\prime}, M_{2}{ }^{\prime}, M_{3}, \ldots, M_{c}$. Furthermore,

$$
e_{1}^{\prime}=\left|M_{1}^{\prime}\right|=e_{1}+1
$$

and

$$
e_{2}^{\prime}=\left|M_{2}^{\prime}\right|=e_{2}-1
$$

Now recalling that $e_{1}<k$ and $e_{2}>k$, we have

$$
\left|e_{1}^{\prime}-k\right|<\left|e_{1}-k\right|
$$

and

$$
\left|e_{2}^{\prime}-k\right|<\left|e_{2}-k\right|
$$

Hence

$$
n\left(K_{0}^{\prime}\right)<n\left(K_{0}\right),
$$

and this contradicts the minimality of $n\left(K_{0}\right)$. It thus follows that $n_{0}=0$. This proves the lemma.

We conclude this section by stating a result of Wallis [7].

Lemma 2.3. A d-regular graph $G$ with no 1 -factor and no odd-component satisfies:

$$
v(G) \geq \begin{cases}3 d+7, & \text { for odd } d \geq 3 \\ 3 d+4, & \text { for even } d \geq 6 \\ 22, & \text { for } d=4\end{cases}
$$

No such $G$ exists for $d=1$ or 2 .

## 3. MAIN RESULT

Our main result is essentially a generalization of Theorems 4 and 5 of Caccetta and Wallis [2].

Theorem 3.1. Suppose for odd $d$ there exists a d-set in $K_{2 n}$. Then for each $0 \leq t \leq n-\frac{1}{2}(d+1)$ there is a d-set in $K_{4 n-2 t}$.

Proof: We can write $K_{4 n-2 t}=K_{2 n-2 t} \vee K_{2 n}$. Let $X$ and $Y$ denote the graphs $K_{2 n-2 t}$ and $K_{2 n}$, respectively. Now $Y$ has a maximal set of ( $2 n-$ d - 1) 1-factors. Take $2 t$ of these 1 -factors and let $H$ be the graph formed by the union of these 1 -factors.

Applying Lemma 2.2 (with $c=2 n$ and $k=t$ ) we decompose the edge-set of $H$ into $2 n$ matchings $M_{1}, M_{2}, \ldots, M_{2 n}$, each with $t$ edges. Let $Y_{i}$ denote the vertices of $Y$ not saturated by the matching $M_{i}$. Note that since $H$ has regularity $2 t$, each vertex in $Y$ will be contained in exactly $2 n-2 t$ of the $Y_{i}$ 's. Furthermore, each $Y_{i}$ contains exactly $2 n-2 t$ vertices of $Y$.

Now we apply Lemma 2.1 to the subgraph $K_{2 n-2 t, 2 n}$. This yields 2n disjoint matchings $N_{1}, N_{2}, \ldots, N_{2 n}$, where $N_{i}$ joins the vertices of $Y_{i}$ to the vertices of $X$. Let

$$
L_{i}=M_{i} \cup N_{i} \quad i=1,2, \ldots, 2 n
$$

There remain in $Y$ a set $S$ of $(2 n-1-d)-2 t 1$-factors from the original maximal set on $Y$. Construct ( $2 n-1-d$ ) - $2 t 1$-factors on $X$ (such a set exists since $K_{2 p}$ has a 1-factorization) and pair these off with the 1-factors of $S$ to form a set of ( $2 n-1-d-2 t$ ) 1-factors $\bar{L}_{1}, \bar{L}_{2}, \ldots, \bar{L}_{2 n-1-d-2 t}$. Then the set

$$
F=\left\{L_{i}: i=1,2, \ldots, 2 n\right\} \cup\left\{\bar{L}_{j}: j=1,2, \ldots, 2 n-1-d-2 t\right\}
$$

forms a maximal set of 1-factors of deficiency $d$ in $K_{4 n-2 t}$. Note that the leave $\overline{\mathrm{F}}$ of F consists of 2 -components one of which is the leave of the maximal set of 1 -factors in $K_{2 n}$. This completes the proof of the theorem.

As a corollary we have:
Corollary: If $K_{2 n}$ has a d-set, $d$ odd, then for each even integer $m \geq$ $2 n+d+1, K_{m}$ has a d-set.

Proof: Suppose $K_{2 n}$ has a d-set, $d$ odd. Then by Theorem 3.1 there exists a $d-s e t$ in $K_{2 n+d+1}, K_{2 n+d+3}, \ldots, K_{4 n}$. Further a d-set in $K_{2 n+d+1}$ implies a d-set in $K_{2 n+2 d+2}, K_{2 n+2 d+4}, \ldots, K_{4 n+2 d+2}$. Now since a d-set in $K_{2 n}$ implies (Dirac's Theorem) that $d \leq n$ we have $2 n+$ $2 d+2 \leq 4 n+2$. Hence repeated applications of Theorem 3.1 will in fact cover all even integers $m \geq 2 n+d+1$. This completes the proof of the Corollary.

## 4. APPLICATION OF THEOREM 3.1

We now discuss the application of Theorem 3.1. First we consider the existence of 3 -sets in $K_{2 n}$. Since, by Lemma 2.3, the smallest 3 -regular graph without a 1 -factor contains at least 16 vertices, $K_{2 n}$ has no 3 -set for $2 n \leq 14$. A 3 -set in $K_{16}$ was shown in [2]. The above result implies that if we can find a 3 -set in $K_{18}$, then we have a 3 -set in $K_{2 n}$ for every $2 n \geq 16$. This is the case as shown in [2]. We remark that the proof that $K_{2 n}$ has a 3-set for every $2 n \geq 16$ in [2] involved the construction of 3 -sets in $K_{2 n}$ for $16 \leq 2 n$ $\leq 28$. Application of Theorem 3.1 eliminates the need to look at the cases $20 \leq 2 n \leq 28$.

We now illustrate the work involved in establishing the existence of $d$-sets, by consider the case $d=5$.

Lemma 2.3 implies that 5 -sets do not exist in $K_{2 n}$ for $2 n \leq 20$. So suppose $2 n \geq 22$. We will exhibit 5 -sets in $K_{22}, K_{24}$ and $K_{26}$. Then the corollary to Theorem 3.1 implies the existence of 5 --sets in $K_{2 n}$ for every $2 n \geq 22$.

Consider $K_{22}$ with vertices labelled $1,2, \ldots, 9, A, B, \ldots, M$. Take the 16 1-factors:

| $\mathrm{T}_{1}$ | $=$ | 18 | 25 | 3D | 4L | JC | 6 H | 7A | 9 I | BF | EK | MG |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{2}$ | = | 15 | 2G | 3E | 4 I | 8H | 6A | 7 J | 9 F | BK | CM | DL |
| $\mathrm{T}_{3}$ | $=$ | 19 | 2 E | 3L | 4H | 5D | 6J | 7G | 8K | AF | BM | CI |
| T4 | $=$ | 1 A | 2 H | 3 F | 4 M | 5C | 61 | 7K | 8L | 9 D | BG | EJ |
| $\mathrm{T}_{5}$ | $=$ | 1B | 2 F | 3K | 4C | 5 I | 6 D | 7 L | 8J | 9 M | AH | GE |
| $\mathrm{T}_{6}$ | = | 1 C | 29 | 3H | 4 J | 5K | 6 F | 7E | 8G | DI | AM | BL |
| $\mathrm{T}_{7}$ | $=$ | 1D | 21 | 3M | 4 F | 5A | 6G | 7H | 8C | 9K | BJ | EL |
| $\mathrm{T}_{8}$ | $=$ | 1E | 2 C | 3 J | 48 | 5B | 69 | 7D | AI | LH | MF | KG |
| $\mathrm{T}_{9}$ | $=$ | 1 F | 2 L | 3G | 4 E | 59 | 6M | 7 C | 8I | A. ${ }^{\text {d }}$ | DK | BH |
| $T_{10}$ | $=$ | 1G | 2 M | 38 | 47 | 5E | 6B | LI | AK | CH | DF | 9 J |
| $\mathrm{T}_{11}$ | = | 1H | 2 J | 3A | 4 K | 5G | 6C | 7M | 8 F | 9 L | BI | DE |
| $\mathrm{T}_{12}$ | = | 1 I | 2A | 36 | 4 B | 58 | HE | 7 F | LC | 9G | DJ | KM |
| $\mathrm{T}_{13}$ | $=$ | 1 J | 28 | 3 C | 49 | SL | DG | 71 | $A B$ | FE | HM | K6 |
| $\mathrm{T}_{14}$ | = | 1 K | 2 B | 79 | 4A | 5 F | 6L | 31 | 8E | CG | DH | JM |
| $\mathrm{T}_{15}$ | $=$ | 1L | 2 K | 3B | 4D | 5J | 6E | 78 | 9H | AG | FC | MI |
| $T_{16}$ | = | 1M | 2D | 39 | 4G | 5H | 68 | 7B | CK | AL | FJ | EI |

The leave of this set of 1 -factors is given in Figure 4.1. Thus we have a 5 -set in $K_{22}$.

Figure 4.1

Consider $\mathrm{K}_{24}$ with vertices labelled $1,2, \ldots, 9, \mathrm{~A}, \mathrm{~B}, \ldots, 0$. Take the 18 1-factors:

| $\mathrm{R}_{1}$ | $=$ | 14 | 2 J | 38 | DI | 5G | 8 F | 7 E | NO | 9H | AL | BM | CK |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{R}_{2}$ | $=$ | 16 | 2D | 30 | 4 B | 58 | 9L | 7 C | JN | AE | FG | HK | MI |
| $\mathrm{R}_{3}$ | = | 17 | 25 | 3 L | 48 | 6M | 9K | AN | BF | CD | EH | GI | Jo |
| $\mathrm{R}_{4}$ | $=$ | 1 A | 2 N | 3M | 47 | 59 | 6 J | 8C | BL | DH | EO | FI | GK |

| $\mathrm{R}_{6}$ | $=$ | 10 | 2K | 31 | 4 L | $5 B$ | 6C | 7M | 8D | 9A | GJ | EN | FH |
| $\mathrm{R}_{7}$ | $=$ | 1D | 2G | 3E | 4 F | 5 I | 6N | 7H | 8M | 9C | AK | BJ | LO |
| $\mathrm{R}_{8}$ | $=$ | 1 C | 2 F | 3H | 4 C | 50 | 6K | 7N | 81 | 9B | AM | EJ | DL |
| $\mathrm{R}_{9}$ | = | 1E | 2 H | 3 F | 40 | 5 J | 6G | 7K | 8L | 90 | AI | EN | CM |
| $\mathrm{R}_{10}$ | $=$ | 1 L | 2A | 37 | $4 \mathrm{~K}^{*}$ | 5 C | 6E | 8J | 9 F | BH | DM | GN | 10 |
| $\mathrm{R}_{11}$ | $=$ | 1G | 2 B | 3A | 4 J | 5H | 6D | 71 | 8K | 9 E | CL. | MO | FN |
| $\mathrm{R}_{12}$ | $=$ | 1H | 2 L | 3 J | 4A | 5E | 6B | 7 D | 8G | 9 N | CI | FM | KO |
| $\mathrm{R}_{13}$ | $=$ | 11 | 26 | 39 | 4 C | 5D | 70 | 8 N | AH | BK | EL | FJ | GM |
| $\mathrm{R}_{14}$ | $=$ | 1 J | 28 | 3K | 41 | 5 F | 6A | 7 B | 96 | CO | DN | EM | HL |
| $\mathrm{R}_{15}$ | $=$ | 1K | 2M | CN | 4 E | 5 A | 6H | 7 F | 80 | 9J | GL. | 3D | BI |
| $\mathrm{R}_{16}$ | = | 1 F | 2C | 38 | DO | 6 L | 7 J | 91 | 5M | AG | EK | 4 N | 8H |
| $\mathrm{R}_{17}$ | $=$ | 1 M | 2 E | 3G | DK | 5N | FL | 7 A | 8B | 90 | 4H | 61 | CJ |
| $\mathrm{R}_{18}$ | $=$ | 1 N | 21 | 3C | 4D | 5K | 6F | 7 L | 8E | 9M | HG | AJ | BO | thus have a 5 -set in $K_{24}$.

Figure 4.2

Finally, consider $K_{26}$ with vertices labelled $1,2, \ldots, 9$, A, $B, \ldots, Q$. A suitable 5 -set is:
$T_{1}=14 \quad 2 \mathrm{G} \quad 30 \quad 5 \mathrm{~L} \quad 6 \mathrm{~J} \quad 7 \mathrm{M} \quad 8 \mathrm{C} \quad 9 \mathrm{H} \quad 10 \quad \mathrm{BF} \quad \mathrm{DP} \quad \mathrm{EK} \quad \mathrm{NI}$
$T_{2}=15 \quad 27 \quad 39 \quad 4 \mathrm{C} \quad 6 \mathrm{~B} \quad 8 \mathrm{~A} \quad \mathrm{DK} \quad \mathrm{EQ} \quad \mathrm{FN} \quad \mathrm{GM} \quad \mathrm{HL} \quad 10 \quad \mathrm{JP}$
$T_{3}=\begin{array}{llllllllllll}16 & 2 A & 3 C & 49 & 50 & 7 D & 8 B & E P & F I & G K & H N & J M\end{array} \quad L Q$
$\begin{array}{llllllllllllll}T_{4} & = & 17 & 28 & 36 & 4 B & 5 A & 9 C & D E & F H & G J & I L & K N & M P\end{array} \quad O Q$
$T_{5}=1 A \quad 2 \mathrm{D} \quad 3 \mathrm{~B} \quad 47 \quad 5 \mathrm{I} \quad 8 \mathrm{~N} \quad 8 \mathrm{~F} \quad 9 \mathrm{P} \quad \mathrm{CO} \quad \mathrm{EJ} \quad \mathrm{GL} \quad \mathrm{HK} \quad \mathrm{MQ}$
$T_{6}=1 B \quad 2 \mathrm{M} \quad 3 \mathrm{H} \quad 4 \mathrm{~L} \quad 5 \mathrm{~K} \quad 6 \mathrm{P} \quad 7 \mathrm{~A} \quad 8 \mathrm{E} \quad 9 \mathrm{~J} \quad \mathrm{CQ} \quad \mathrm{DI} \quad \mathrm{FO} \quad \mathrm{GN}$
$T_{7}=\begin{array}{lllllllllllll}1 \mathrm{C} & 2 \mathrm{~L} & 3 \mathrm{~J} & 4 \mathrm{G} & 5 \mathrm{P} & 6 \mathrm{M} & 7 \mathrm{H} & 8 \mathrm{I} & 9 B & A K & \mathrm{DN} & \mathrm{EO} & \mathrm{FQ}\end{array}$
$T_{8}=1 \mathrm{D} \quad 2 \mathrm{~F} \quad 3 \mathrm{~N} \quad 4 \mathrm{~K} \quad 5 \mathrm{E} \quad 6 \mathrm{H} \quad 7 \mathrm{~L} \quad 80 \quad 9 \mathrm{~A} \quad \mathrm{BI} \quad \mathrm{CM} \quad \mathrm{GP} \quad \mathrm{JQ}$
$T_{9}=\begin{array}{llllllllllll}1 \mathrm{E} & 2 \mathrm{~B} & 38 & 4 \mathrm{~A} & 5 \mathrm{~N} & 6 \mathrm{~L} & 7 \mathrm{C} & \mathrm{DM} & 9 \mathrm{~K} & \mathrm{FP} & \mathrm{GH} & \mathrm{IQ} \\ \mathrm{J}\end{array}$
$T_{10}=1 \mathrm{~F} \quad 2 \mathrm{Q} \quad 3 \mathrm{D} \quad 4 \mathrm{P} \quad 5 \mathrm{~J} \quad 60 \quad 7 \mathrm{G} \quad 8 \mathrm{~K} \quad 9 \mathrm{I} \quad \mathrm{AB} \quad \mathrm{CL} \quad \mathrm{EN} \quad \mathrm{HM}$
$T_{11}=1 \mathrm{G} \quad 20 \quad 3 \mathrm{P} \quad 4 \mathrm{D} \quad 5 \mathrm{C} \quad 6 \mathrm{~F} \quad 7 \mathrm{~J} \quad 8 \mathrm{M} \quad 9 \mathrm{~N} \quad \mathrm{BL} \quad \mathrm{AH} \quad \mathrm{EI} \quad \mathrm{KQ}$

$T_{13}=1 I \quad 2 \mathrm{~N} \quad 3 \mathrm{M} \quad 40 \quad 58 \quad 5 \mathrm{~A} \quad 7 \mathrm{E} \quad 9 \mathrm{G} \quad \mathrm{BH} \quad \mathrm{CJ} \quad \mathrm{DQ} \quad \mathrm{FL} \quad \mathrm{KP}$
$T_{14}=1 \mathrm{~J} \quad 2 \mathrm{~K} \quad 3 \mathrm{G} \quad 4 \mathrm{E} \quad 5 \mathrm{~B} \quad 6 \mathrm{I} \quad 7 \mathrm{P} \quad 8 \mathrm{H} \quad 9 \mathrm{Q} \quad \mathrm{AL} \quad \mathrm{CN} \quad \mathrm{DO} \quad \mathrm{FM}$ $T_{15}=1 \mathrm{~K} \quad 2 \mathrm{~J} \quad 30 \quad 4 \mathrm{Q} \quad 5 \mathrm{~F} \quad 6 \mathrm{D} \quad 7 \mathrm{~N} \quad 8 \mathrm{~L} \quad 9 \mathrm{E} \quad \mathrm{AP} \quad \mathrm{BM} \quad \mathrm{CH} \quad \mathrm{GI}$ $T_{16}=1 \mathrm{~L} \quad 2 \mathrm{H} \quad 3 \mathrm{E} \quad 4 \mathrm{I} \quad 5 \mathrm{M} \quad 6 \mathrm{~K} \quad 7 \mathrm{~F} \quad 8 \mathrm{Q} \quad 9 \mathrm{D} \quad \mathrm{AN} \quad \mathrm{CP} \quad \mathrm{BJ} \quad 60$ $\begin{array}{lllllllllllll}T_{17} & 1 \mathrm{M} & 2 \mathrm{P} & 3 \mathrm{~L} & 4 \mathrm{~F} & 5 \mathrm{D} & 6 \mathrm{Q} & 7 \mathrm{I} & 8 \mathrm{G} & 90 & \mathrm{AJ} & \mathrm{BN} & \mathrm{CK} \\ \mathrm{EH}\end{array}$ $T_{18}=1 \mathrm{~N} \quad 2 \mathrm{I} \quad 3 \mathrm{~K} \quad 4 \mathrm{~J} \quad 5 \mathrm{H}$ 6C $\quad 7 \mathrm{Q} \quad 8 \mathrm{D} \quad 9 \mathrm{~F} \quad \mathrm{AG} \quad \mathrm{BP} \quad \mathrm{EM} \quad$ LO $\mathrm{T}_{19}=10 \quad 2 \mathrm{C} \quad 3 \mathrm{I} \quad 4 \mathrm{H} \quad 5 \mathrm{G}$ $69 \quad 7 \mathrm{~B} \quad 8 \mathrm{~N} \quad \mathrm{AM} \quad \mathrm{EL} \quad \mathrm{DJ} \quad \mathrm{FK} \quad \mathrm{PQ}$ $\begin{array}{lllllllllllll}T_{20} & = & 1 P & 25 & 3 F & 4 M & D H & 6 E & 7 K & 8 J & 9 L & A I & B O \\ C G & N Q\end{array}$ The leave of this set is given in Figure 4.3.

Figure 4.3

We have proved:

Theorem 4.1. There exists a 5 -set in $K_{2 n}$ for every $2 n \geq 22$.

ACKNOWLEDGEMENT: We wish to express our sincere thanks to Professor Rolf Rees for a number of useful discussions on the problem which lead to a much simpler proof of Theorem 3.1.
