# Semi-evenly partite star-factorization of symmetric complete tripartite digraphs 

Kazuhiko Ushio<br>Department of Industrial Engineering<br>Faculty of Science and Technology<br>Kinki University, Osaka 577-8502, JAPAN<br>E-mail:ushio@is.kindai.ac.jp

#### Abstract

We show that necessary and sufficient conditions for the existence of a semi-evenly partite star - factorization of the symmetric complete tripartite digraph $K_{n_{1}, n_{2}, n_{3}}^{*}$ are (i) $k$ is even, $k \geq 4$ and (ii) $n_{1}=n_{2}=n_{3} \equiv 0$ $(\bmod k(k-1) / 3)$ for $k \equiv 0(\bmod 6)$ and $n_{1}=n_{2}=n_{3} \equiv 0(\bmod k(k-1))$ for $k \equiv 2,4(\bmod 6)$.

## 1. Introduction

Let $K_{n_{1}, n_{2}, n_{3}}^{*}$ denote the symmetric complete tripartite digraph with partite sets $V_{1}, V_{2}, V_{3}$ of $n_{1}, n_{2}, n_{3}$ vertices each, and let $\check{S}_{k}$ denote the semi-evenly partite directed star from a center-vertex to $k-1$ end-vertices such that the center-vertex is in $V_{i}$ and $(k-2) / 2$ end-vertices are in $V_{j_{1}}$ and $k / 2$ end-vertices are in $V_{j_{2}}$ with $\left\{i, j_{1}, j_{2}\right\}=\{1,2,3\}$. A spanning subgraph $F$ of $K_{n_{1}, n_{2}, n_{3}}^{*}$ is called an $\tilde{S}_{k}$-factor if each component of $F$ is $\tilde{S}_{k}$. If $K_{n_{1}, n_{2}, n_{3}}^{*}$ is expressed as an arc-disjoint sum of $\tilde{S}_{k}$-factors, then this sum is called an $\tilde{S}_{k}$-factorization of $K_{n_{1}, n_{2}, n_{3}}^{*}$.
In this paper, it is shown that necessary and sufficient conditions for the existence of such a factorization are (i) $k$ is even, $k \geq 4$ and (ii) $n_{1}=n_{2}=n_{3} \equiv 0(\mathrm{mod}$ $k(k-1) / 3)$ for $k \equiv 0(\bmod 6)$ and $n_{1}=n_{2}=n_{3} \equiv 0(\bmod k(k-1))$ for $k \equiv 2,4$ $(\bmod 6)$.

Let $K_{n_{1}, n_{2}}, K_{n_{1}, n_{2}}^{*}, K_{n_{1}, n_{2}, n_{3}}^{*}$, and $K_{n_{1}, n_{2}, \ldots, n_{m}}^{*}$ denote the complete bipartite graph, the symmetric complete bipartite digraph, the symmetric complete tripartite digraph, and the symmetric complete multipartite digraph, respectively. And let $\hat{C}_{k}, \hat{S}_{k}, \hat{P}_{k}$, and $\hat{K}_{p, q}$ denote the cycle or the directed cycle, the star or the directed star, the path or the directed path, and the complete bipartite graph or the complete bipartite digraph, respectively, on two partite sets $V_{i}$ and $V_{j}$. Then the problems of giving the necessary and sufficient conditions of $\hat{C}_{k}$ - factorization of $K_{n_{1}, n_{2}}, K_{n_{1}, n_{2}}^{*}, K_{n_{1}, n_{2}, n_{3}}^{*}$, and $K_{n_{1}, n_{2}, \ldots, n_{m}}^{*}$ have been completely solved by Enomoto, Miyamoto and Ushio[2]
and Ushio $[11,14] . \hat{S}_{k}$ - factorization of $K_{n_{1}, n_{2}}, K_{n_{1}, n_{2}}^{*}$, and $K_{n_{1}, n_{2}, n_{3}}^{*}$ have been studied by Ushio and Tsuruno[8], Ushio[13], and Wang[15]. Recently, Martin[4,5] and Ushio[10] give the necessary and sufficient conditions of $\hat{S}_{k}$ - factorization of $K_{n_{1}, n_{2}}$ and $K_{n_{1}, n_{2}}^{*}$. $\hat{P}_{k}$ - factorization of $K_{n_{1}, n_{2}}$ and $K_{n_{1}, n_{2}}^{*}$ have been studied by Ushio and Tsuruno[7], and Ushio[6,9]. $\hat{K}_{p, q}$ - factorization of $K_{n_{1}, n_{2}}$ has been studied by Martin[4]. Ushio[12] gives necessary and sufficient conditions for a $\hat{K}_{p, q}$ - factorization of $K_{n_{1}, n_{2}}^{*}$. For graph theoretical terms, see [1,3].

## 2. $\tilde{S}_{k}$ - factorization of $K_{n_{1}, n_{2}, n_{3}}^{*}$

We use the following notation.
Notation. Given an $\tilde{S}_{k}$ - factorization of $K_{n_{1}, n_{2}, n_{3}}^{*}$, let
$r$ be the number of factors
$t$ be the number of components of each factor
$b$ be the total number of components.
Among $r$ components having vertex $x$ in $V_{i}$, let $r_{i j}$ be the number of components whose center-vertex is in $V_{j}$.

We give the following necessary conditions for the existence of an $\tilde{S}_{k}$-factorization of $K_{n_{1}, n_{2}, n_{3}}^{*}$.

Theorem 1. If $K_{n_{1}, n_{2}, n_{3}}^{*}$ has an $\tilde{S}_{k}$-factorization, then (i) $k$ is even, $k \geq 4$ and (ii) $n_{1}=n_{2}=n_{3} \equiv 0(\bmod k(k-1) / 3)$ for $k \equiv 0(\bmod 6)$ and $n_{1}=n_{2}=n_{3} \equiv 0$ $(\bmod k(k-1))$ for $k \equiv 2,4(\bmod 6)$.

Proof. Suppose that $K_{n_{1}, n_{2}, n_{3}}^{*}$ has an $\tilde{S}_{k}$-factorization. Then $b=2\left(n_{1} n_{2}+n_{1} n_{3}+\right.$ $\left.n_{2} n_{3}\right) /(k-1), t=\left(n_{1}+n_{2}+n_{3}\right) / k, r=b / t=2\left(n_{1} n_{2}+n_{1} n_{3}+n_{2} n_{3}\right) k /\left(n_{1}+n_{2}+\right.$ $\left.n_{3}\right)(k-1)$. By the definition of $\tilde{S}_{k}, k$ is even and $k \geq 4$.
For a vertex $x$ in $V_{1}$, we have $r_{11}(k-1)=n_{2}+n_{3}, r_{12}=n_{2}, r_{13}=n_{3}$, and $r_{11}+r_{12}+r_{13}=r$. For a vertex $x$ in $V_{2}$, we have $r_{22}(k-1)=n_{1}+n_{3}, r_{21}=n_{1}$, $r_{23}=n_{3}$, and $r_{21}+r_{22}+r_{23}=r$. For a vertex $x$ in $V_{3}$, we have $r_{33}(k-1)=n_{1}+n_{2}$, $r_{31}=n_{1}, r_{32}=n_{2}$, and $r_{31}+r_{32}+r_{33}=r$. Therefore, we have $n_{1}=n_{2}=n_{3}$. Put $n_{1}=n_{2}=n_{3}=n$. Then $r_{11}=r_{22}=r_{33}=2 n /(k-1), r_{12}=r_{13}=r_{21}=r_{23}=r_{31}=$ $r_{32}=n, b=6 n^{2} /(k-1), t=3 n / k, r=2 n k /(k-1)$.
Since $k$ is even and $k \geq 4$, we must have $3 n \equiv 0(\bmod k)$ and $n \equiv 0(\bmod k-1)$. Therefore, we have $n \equiv 0(\bmod k(k-1) / 3)$ for $k \equiv 0(\bmod 6)$ and $n \equiv 0(\bmod$ $k(k-1))$ for $k \equiv 2,4(\bmod 6)$.

We prove the following extension theorem, which we use later in this paper.
Theorem 2. If $K_{n, n, n}^{*}$ has an $\tilde{S}_{k}$-factorization, then $K_{s n, s n, s n}^{*}$ has an $\tilde{S}_{k}$-factorization.

Proof. Let $K_{q_{1}, q_{2} \oplus q_{3}}$ denote the tripartite digraph with partite sets $U_{1}, U_{2}, U_{3}$ of $q_{1}, q_{2}, q_{3}$ vertices such that $q_{1}$ start-vertices in $U_{1}$ are adjacent to both $q_{2}$ end-vertices in $U_{2}$ and $q_{3}$ end-vertices in $U_{3}$. Then $\check{S}_{k}$ can be denoted by $K_{1, a \oplus(a+1)}$ for $k=2 a+2$. When $K_{n, n, n}^{*}$ has an $\tilde{S}_{k}$ - factorization, $K_{s n, s n, s n}^{*}$ has a $K_{s, s a \oplus s(a+1)}$ - factorization. $K_{s, s a \oplus s(a+1)}$ has an $\tilde{S}_{k}$-factorization. Therefore, $K_{s n, s n, s n}^{*}$ has an $\tilde{S}_{k}$-factorization.

We give the following sufficient conditions for the existence of an $\tilde{S}_{k}$-factorization of $K_{n, n, n}^{*}$.

Theorem 3. When $k$ is even, $k \geq 4$ and $n \equiv 0(\bmod k(k-1)), K_{n, n, n}^{*}$ has an $\tilde{S}_{k}-$ factorization.

Proof. Put $n=k(k-1) s, N=k(k-1)$. When $s=1$, let $V_{1}=\{1,2, \ldots, N\}$, $V_{2}=\left\{1^{\prime}, 2^{\prime}, \ldots, N^{\prime}\right\}, V_{3}=\left\{1^{\prime \prime}, 2^{\prime \prime}, \ldots, N^{\prime \prime}\right\}$. For $i=1,2, \ldots, k$ and $j=1,2, \ldots, k$, construct $2 k^{2} \tilde{S}_{k}$ - factors $F_{i j}^{(1)}, F_{i j}^{(2)}$ as follows:
$F_{i j}^{(1)}=\left\{\left((A+1) ;(B+(k-1)+1, \ldots, B+(k-1)+(k-2) / 2)^{\prime},(C+(k-1)+(k-\right.\right.$ 2) $\left./ 2+1, \ldots, C+2(k-1))^{\prime \prime}\right)$
$\left((A+2) ;(B+2(k-1)+1, \ldots, B+2(k-1)+(k-2) / 2)^{\prime},(C+2(k-1)+(k-2) / 2+\right.$ $\left.1, \ldots, C+3(k-1))^{\prime \prime}\right)$
$\left((A+k-1) ;\left(B+(k-1)^{2}+1, \ldots, B+(k-1)^{2}+(k-2) / 2\right)^{\prime},\left(C+(k-1)^{2}+(k-\right.\right.$ 2) $\left./ 2+1, \ldots, C+k(k-1))^{\prime \prime}\right)$
$\left((B+1)^{\prime} ;(C+(k-1)+1, \ldots, C+(k-1)+(k-2) / 2)^{\prime \prime},(A+(k-1)+(k-2) / 2+\right.$ $1, \ldots, A+2(k-1)))$
$\left((B+2)^{\prime} ;(C+2(k-1)+1, \ldots, C+2(k-1)+(k-2) / 2)^{\prime \prime},(A+2(k-1)+(k-\right.$ 2) $/ 2+1, \ldots, A+3(k-1)))$
$\left((B+k-1)^{\prime} ;\left(C+(k-1)^{2}+1, \ldots, C+(k-1)^{2}+(k-2) / 2\right)^{\prime \prime},\left(A+(k-1)^{2}+(k-\right.\right.$ 2) $/ 2+1, \ldots, A+k(k-1)))$
$\left((C+1)^{\prime \prime} ;(A+(k-1)+1, \ldots, A+(k-1)+(k-2) / 2),(B+(k-1)+(k-2) / 2+\right.$ $\left.1, \ldots, B+2(k-1))^{\prime}\right)$
$\left((C+2)^{\prime \prime} ;(A+2(k-1)+1, \ldots, A+2(k-1)+(k-2) / 2),(B+2(k-1)+(k-2) / 2+\right.$ $\left.1, \ldots, B+3(k-1))^{\prime}\right)$
$\left((C+k-1)^{\prime \prime} ;\left(A+(k-1)^{2}+1, \ldots, A+(k-1)^{2}+(k-2) / 2\right),\left(B+(k-1)^{2}+(k-\right.\right.$ 2) $\left.\left./ 2+1, \ldots, B+k(k-1))^{\prime}\right)\right\}$,
$F_{i j}^{(2)}=\left\{\left((A+1) ;(C+(k-1)+1, \ldots, C+(k-1)+(k-2) / 2)^{\prime \prime},(B+(k-1)+(k-\right.\right.$ 2) $\left./ 2+1, \ldots, B+2(k-1))^{\prime}\right)$
$\left((A+2) ;(C+2(k-1)+1, \ldots, C+2(k-1)+(k-2) / 2)^{\prime \prime},(B+2(k-1)+(k-2) / 2+\right.$ $\left.1, \ldots, B+3(k-1))^{\prime}\right)$
$\cdots\left((A+k-1) ;\left(C+(k-1)^{2}+1, \ldots, C+(k-1)^{2}+(k-2) / 2\right)^{\prime \prime},\left(B+(k-1)^{2}+(k-\right.\right.$
2) $\left./ 2+1, \ldots, B+k(k-1))^{\prime}\right)$
$\left((B+1)^{\prime} ;(A+(k-1)+1, \ldots, A+(k-1)+(k-2) / 2),(C+(k-1)+(k-2) / 2+\right.$ $\left.1, \ldots, C+2(k-1))^{\prime \prime}\right)$
$\left((B+2)^{\prime} ;(A+2(k-1)+1, \ldots, A+2(k-1)+(k-2) / 2),(C+2(k-1)+(k-2) / 2+\right.$
$\left.1, \ldots, C+3(k-1))^{\prime \prime}\right)$
$\left((B+k-1)^{\prime} ;\left(A+(k-1)^{2}+1, \ldots, A+(k-1)^{2}+(k-2) / 2\right),\left(C+(k-1)^{2}+(k-\right.\right.$
2) $\left./ 2+1, \ldots, C+k(k-1))^{\prime \prime}\right)$
$\left((C+1)^{\prime \prime} ;(B+(k-1)+1, \ldots, B+(k-1)+(k-2) / 2)^{\prime},(A+(k-1)+(k-2) / 2+\right.$ $1, \ldots, A+2(k-1)))$
$\left((C+2)^{\prime \prime} ;(B+2(k-1)+1, \ldots, B+2(k-1)+(k-2) / 2)^{\prime},(A+2(k-1)+(k-\right.$ 2) $/ 2+1, \ldots, A+3(k-1)))$
$\left((C+k-1)^{\prime \prime} ;\left(B+(k-1)^{2}+1, \ldots, B+(k-1)^{2}+(k-2) / 2\right)^{\prime},\left(A+(k-1)^{2}+(k-\right.\right.$ 2) $/ 2+1, \ldots, A+k(k-1)))\}$,
where $A=(i-1)(k-1), B=(j-1)(k-1), C=(i+j-2)(k-1)$, and the additions are taken modulo $N$ with residues $1,2, \ldots, N$.
Then we claim that they comprise an $\tilde{S}_{k}$-factorization of $K_{N, N, N}^{*}$.
We can see that each of them is an $\tilde{S}_{k}$-factor, because it spans all vertices of $K_{N, N, N}^{*}$. We show that they are arc-disjoint.
Suppose that they are not arc-disjoint. In the following, we consider $A=(i-1)(k-1)$, $B=(j-1)(k-1), C=(i+j-2)(k-1), D=(h-1)(k-1), E=(l-1)(k-1)$, $F=(h+l-2)(k-1), 1 \leq i, j, h, l \leq k$. Note that $A, B, C, D, E, F, N$ are integral multiples of $k-1$.
Let $\left(X, Y^{\prime}\right)$ be an arc joining from $V_{1}$ to $V_{2}$ and let $x$ and $y$ be the residues of $X$ and $Y$ modulo $k-1$, respectively. Then the arc $\left(X, Y^{\prime}\right)$ can appear only in the $x$-th components of $F_{i j_{e}}^{(1)}, F_{h l}^{(2)}$ according as $1 \leq y \leq(k-2) / 2,(k-2) / 2+1 \leq y \leq k-1$, respectively.
First, we assume that the common arc joining from $V_{1}$ to $V_{2}$ appears in the $x$-th component $\left((A+x) ;(B+x(k-1)+1, \ldots, B+x(k-1)+(k-2) / 2)^{\prime},(C+x(k-1)+(k-\right.$ 2) $\left./ 2+1, \ldots, C+(x+1)(k-1))^{\prime \prime}\right)$ of $F_{i j}^{(1)}$ and the $x$-th component $((D+x) ;(E+x(k-$ 1) $\left.+1, \ldots, E+x(k-1)+(k-2) / 2)^{\prime},(F+x(k-1)+(k-2) / 2+1, \ldots, F+(x+1)(k-1))^{\prime \prime}\right)$ of $F_{h l}^{(1)}$.
Say $\left((A+x),(B+x(k-1)+y)^{\prime}\right)=\left((D+x),(E+x(k-1)+y)^{\prime}\right)$, where $1 \leq y \leq(k-2) / 2$. Then $A+x \equiv D+x(\bmod N)$ and $B+x(k-1)+y \equiv E+x(k-1)+y(\bmod N)$. From the congruences, we have $A=D$ and $B=E$, which implies $i=h$ and $j=l$. This contradicts the assumption.
Next, we assume that the common arc joining from $V_{1}$ to $V_{2}$ appears in the $x$-th component $\left((A+x) ;(C+x(k-1)+1, \ldots, C+x(k-1)+(k-2) / 2)^{\prime \prime},(B+x(k-1)+(k-\right.$ 2) $\left./ 2+1, \ldots, B+(x+1)(k-1))^{\prime}\right)$ of $F_{i j}^{(2)}$ and the $x$-th component $((D+x) ;(F+x(k-$ 1) $\left.+1, \ldots, F+x(k-1)+(k-2) / 2)^{\prime \prime},(E+x(k-1)+(k-2) / 2+1, \ldots, E+(x+1)(k-1))^{\prime \prime}\right)$ of $F_{h l}^{(2)}$.
Say $\left((A+x),(B+x(k-1)+y)^{\prime}\right)=\left((D+x),(E+x(k-1)+y)^{\prime}\right)$, where $(k-2) / 2+1 \leq$ $y \leq k-1$.

Then $A+x \equiv D+x(\bmod N)$ and $B+x(k-1)+y \equiv E+x(k-1)+y(\bmod N)$. From the congruences, we have $A=D$ and $B=E$, which implies $i=h$ and $j=l$. This contradicts the assumption.
Thus, there is no common arc joining from $V_{1}$ to $V_{2}$.
Similarly, there are no common arcs joining from $V_{1}$ to $V_{3}$, from $V_{2}$ to $V_{1}$, from $V_{2}$ to $V_{3}$, from $V_{3}$ to $V_{1}$, or from $V_{3}$ to $V_{2}$.
Therefore, $2 k^{2} \tilde{S}_{k}$ - factors $F_{i j}^{(1)}, F_{i j}^{(2)}$ comprise an $\check{S}_{k}$ - factorization of $K_{N, N, N}^{*}$. Applying Theorem 2, $K_{n, n, n}^{*}$ has an $\tilde{S}_{k}$-factorization.

Theorem 4. When $k \equiv 0(\bmod 6)$ and $n \equiv 0(\bmod k(k-1) / 3), K_{n, n, n}^{*}$ has an $\tilde{S}_{k}-$ factorization.

Proof. Put $k=6 p, n=2 p(6 p-1) s, N=2 p(6 p-1)$. When $s=1$, let $V_{1}=\{1,2, \ldots, N\}, V_{2}=\left\{1^{\prime}, 2^{\prime}, \ldots, N^{\prime}\right\}, V_{3}=\left\{1^{\prime \prime}, 2^{\prime \prime}, \ldots, N^{\prime \prime}\right\}$. For $i=1,2, \ldots, 2 p$ and $j=1,2, \ldots, 2 p$, construct $24 p^{2} \tilde{S}_{k}$ - factors $F_{i j}^{(1)}, F_{i j}^{(2)}, F_{i j}^{(3)}, F_{i j}^{(4)}, F_{i j}^{(5)}, F_{i j}^{(6)}$ as follows:
First, construct $F_{i j}^{(1)}$.
$F_{i j}^{(1)}=\{((A+x) ;(B+(6 p-1) p-(x-1)(3 p-1)+3 p+1, \ldots, B+(6 p-1) p-(x-1)(3 p-$ $1)+6 p-1),(C+(6 p-1)+(x-1) 3 p+1, \ldots, C+(6 p-1)+(x-1) 3 p+3 p)) \mid 1 \leq x \leq 2 p\}$ $\cup\{((B+x) ;(C+(6 p-1)(p+1)+(x-2 p-1)(3 p-1)+p+1, \ldots, C+(6 p-1)(p+$ 1) $+(x-2 p-1)(3 p-1)+4 p-1),(A+(6 p-1) p-(x-2 p-1) 3 p-2 p+1, \ldots, A+$ $(6 p-1) p-(x-2 p-1) 3 p+p)) \mid 2 p+1 \leq x \leq 3 p\}$
$\cup\left\{\left((B+x) ;\left(C+(6 p-1)(p+1)+(x-3 p-1) 3 p+3 p^{2}+1, \ldots, C+(6 p-1)(p+1)+(x-3 p-\right.\right.\right.$ 1) $\left.\left.3 p+3 p^{2}+3 p\right),\left(A-(x-3 p-1)(3 p-1)+3 p^{2}-3 p+2, \ldots, A-(x-3 p-1)(3 p-1)+3 p^{2}\right)\right) \mid$ $3 p+1 \leq x \leq 4 p-1\}$
$\cup\{(C+x) ;(A+(6 p-1) p+p+1, \ldots, A+(6 p-1) p+4 p-1),(B+(6 p-1)-2 p+$ $1, \ldots, B+(6 p-1)+p)) \mid x=4 p\}$
$\cup\{((C+x) ;(A+(6 p-1) 2 p-(x-4 p-1) 3 p-3 p+1, \ldots, A+(6 p-1) 2 p-(x-$ $4 p-1) 3 p),(B+(6 p-1)(p+1)+(x-4 p-1)(3 p-1)+1, \ldots, B+(6 p-1)(p+1)+$ $(x-4 p-1)(3 p-1)+3 p-1)) \mid 4 p+1 \leq x \leq 6 p-2\}$
$\cup\{((C+x) ;(A+2 p+1, \ldots, A+4 p-1, A+(6 p-1) p+4 p, \ldots, A+(6 p-1) p+$ $5 p),(B+(6 p-1) 2 p-p+2, \ldots, B+(6 p-1) 2 p+2 p)) \mid x=6 p-1\}$, where $(A+u),(B+u),(C+u)$ mean $(A+u),(B+u)^{\prime},(C+u)^{\prime \prime}$, respectively, and $A=(i-1)(6 p-1), B=(j-1)(6 p-1), C=(i+j-2)(6 p-1)$, and the additions are taken modulo $N$ with residues $1,2, \ldots, N$.
Next, construct $F_{i j}^{(2)}, F_{i j}^{(3)}, F_{i j}^{(4)}, F_{i j}^{(5)}, F_{i j}^{(6)}$ by applying all possible permutations of $A, B, C$ in $F_{i j}^{(1)}$.
Then we claim that they comprise an $\tilde{S}_{k}$ - factorization of $K_{N, N, N}^{*}$.
We can see that each of them is an $\tilde{S}_{k}$-factor, because it spans all vertices of $K_{N, N, N}^{*}$. We show that they are arc-disjoint.
Suppose that they are not arc-disjoint. Let $\left(X, Y^{\prime}\right)$ be a common arc joining from $V_{1}$ to $V_{2}$ and let $x$ be the residue of $X$ modulo $6 p-1$. Then the arc $\left(X, Y^{\prime}\right)$ can appear only in the $x$-th components of $F_{i j}^{(1)}, F_{i j}^{(2)}, F_{i j}^{(3)}, F_{i j}^{(4)}, F_{i j}^{(5)}$, or $F_{i j}^{(6)}$. But in the same
way as the proof of Theorem 3, there is no common arc in those components. Thus, there is no common arc joining from $V_{1}$ to $V_{2}$.
Similarly, there is no common arc joining from $V_{1}$ to $V_{3}$, from $V_{2}$ to $V_{1}$, from $V_{2}$ to $V_{3}$, from $V_{3}$ to $V_{1}$, or from $V_{3}$ to $V_{2}$. Therefore, those $24 p^{2} \tilde{S}_{k}$-factors $F_{i j}^{(1)}, F_{i j}^{(2)}$, $F_{i j}^{(3)}, F_{i j}^{(4)}, F_{i j}^{(5)}, F_{i j}^{(6)}$ are arc-disjoint.
The total number of arcs in the factors is equal to the total number of arcs in $K_{N, N, N}^{*}$. So the factors do indeed constitute a decomposition of $K_{N, N, N}^{*}$ and comprise an $\tilde{S}_{k}$ factorization of $K_{N, N, N}^{*}$. Applying Theorem $2, K_{n, n, n}^{*}$ has an $\tilde{S}_{k}$-factorization.

We give the following example of Theorem 4.
Example. An $\tilde{S}_{6}$ - factorization of $K_{10,10,10}^{*}$. We have $24 \tilde{S}_{6}$ - factors as follows:
$F_{11}^{(1)}=\left\{\left(1 ; 9^{\prime}, 10^{\prime}, 6^{\prime \prime}, 7^{\prime \prime}, 8^{\prime \prime}\right)\left(2 ; 7^{\prime}, 8^{\prime}, 1^{\prime \prime}, 9^{\prime \prime}, 10^{\prime \prime}\right)\left(3^{\prime} ; 2^{\prime \prime}, 3^{\prime \prime}, 4,5,6\right)\left(4^{\prime \prime} ; 7,8,4^{\prime}, 5^{\prime}, 6^{\prime}\right)\left(5^{\prime \prime} ; 3,9,10,1^{\prime}, 2^{\prime}\right)\right\}$
$F_{11}^{(2)}=\left\{\left(1^{\prime} ; 9^{\prime \prime}, 10^{\prime \prime}, 6,7,8\right)\left(2^{\prime} ; 7^{\prime \prime}, 8^{\prime \prime}, 1,9,10\right)\left(3^{\prime \prime} ; 2,3,4^{\prime}, 5^{\prime}, 6^{\prime}\right)\left(4 ; 7^{\prime}, 8^{\prime}, 4^{\prime \prime}, 5^{\prime \prime}, 6^{\prime \prime}\right)\left(5 ; 3^{\prime}, 9^{\prime}, 10^{\prime}, 1^{\prime \prime}, 2^{\prime \prime}\right)\right\}$
$F_{11}^{(3)}=\left\{\left(1^{\prime \prime} ; 9,10,6^{\prime}, 7^{\prime}, 8^{\prime}\right)\left(2^{\prime \prime} ; 7,8,1^{\prime}, 9^{\prime}, 10^{\prime}\right)\left(3 ; 2^{\prime}, 3^{\prime}, 4^{\prime \prime}, 5^{\prime \prime}, 6^{\prime \prime}\right)\left(4^{\prime} ; 7^{\prime \prime}, 8^{\prime \prime}, 4,5,6\right)\left(5^{\prime} ; 3^{\prime \prime}, 9^{\prime \prime}, 10^{\prime \prime}, 1,2\right)\right\}$
$F_{11}^{(4)}=\left\{\left(1 ; 9^{\prime \prime}, 10^{\prime \prime}, 6^{\prime}, 7^{\prime}, 8^{\prime}\right)\left(2 ; 7^{\prime \prime}, 8^{\prime \prime}, 1^{\prime}, 9^{\prime}, 10^{\prime}\right)\left(3^{\prime \prime} ; 2^{\prime}, 3^{\prime}, 4,5,6\right)\left(4^{\prime} ; 7,8,4^{\prime \prime}, 5^{\prime \prime}, 6^{\prime \prime}\right)\left(5^{\prime} ; 3,9,10,1^{\prime \prime}, 2^{\prime \prime}\right)\right\}$
$F_{11}^{(5)}=\left\{\left(1^{\prime} ; 9,10,6^{\prime \prime}, 7^{\prime \prime}, 8^{\prime \prime}\right)\left(2^{\prime} ; 7,8,1^{\prime \prime}, 9^{\prime \prime}, 10^{\prime \prime}\right)\left(3 ; 2^{\prime \prime}, 3^{\prime \prime}, 4^{\prime}, 5^{\prime}, 6^{\prime}\right)\left(4^{\prime \prime} ; 7^{\prime}, 8^{\prime}, 4,5,6\right)\left(5^{\prime \prime} ; 3^{\prime}, 9^{\prime}, 10^{\prime}, 1,2\right)\right\}$

We have the following main theorem.
Main Theorem. $K_{n_{1}, n_{2}, n_{3}}^{*}$ has an $\tilde{S}_{k}$ - factorization if and only if (i) $k$ is even, $k \geq 4$ and (ii) $n_{1}=n_{2}=n_{3} \equiv 0(\bmod k(k-1) / 3)$ for $k \equiv 0(\bmod 6)$ and $n_{1}=n_{2}=n_{3} \equiv 0$ $(\bmod k(k-1))$ for $k \equiv 2,4(\bmod 6)$.
