#### Abstract

An incomplete self-orthogonal Latin square of order $v$ with an empty subarray of order $n$, an $\operatorname{ISOLS}(v, n)$, can exist only if $v \geq 3 n+1$. This necessary condition is known to be sufficient apart from 2 known exceptions $(v, n)=(6,1)$ and $(8,2)$ plus 14 possible exceptions $(v, n)$ with $v=3 n+2$. In this paper, we construct eleven new $\operatorname{ISOLS}(3 n+2, n)$ reducing unknown $n$ to $6,8,10$ only. This result is then used to improve the existence of HSOLS of type $3^{n} u^{1}$. To do this, two newly found unipotent SOLSSOMs, $\operatorname{SOLSSOM}(66)$ and $\operatorname{SOLSSOM}(70)$ are also useful.

[^0]
## 1 Introduction

Let $S$ be a set and $\mathcal{H}=\left\{S_{1}, S_{2}, \cdots, S_{n}\right\}$ be a set of disjoint subsets of $S$. A holey Latin square having hole set $\mathcal{H}$ is an $|S| \times|S|$ array $L$, indexed by $S$, satisfying the following properties:
(1) every cell of $L$ either contains an element of $S$ or is empty,
(2) every element of $S$ occurs at most once in any row or column of $L$,
(3) the subarrays indexed by $S_{i} \times S_{i}$ are empty for $1 \leq i \leq n$ (these subarrays are referred to as holes ),
(4) element $s \in S$ occurs in row or column $t$ if and only if $(s, t) \in(S \times$ $S) \backslash \bigcup_{1 \leq i \leq n}\left(S_{i} \times S_{i}\right)$.
The order of $L$ is $|S|$. Two holey Latin squares on symbol set $S$ and hole set $\mathcal{H}$, say $L_{1}$ and $L_{2}$, are said to be orthogonal if their superposition yields every ordered pair in $(S \times S) \backslash \bigcup_{1 \leq i \leq n}\left(S_{i} \times S_{i}\right)$. We shall use the notation $\operatorname{IMOLS}\left(s ; s_{1}, \cdots, s_{n}\right)$ to denote a pair of orthogonal holey Latin squares on symbol set $S$ and hole set $\mathcal{H}=\left\{S_{1}, S_{2}, \cdots, S_{n}\right\}$, where $s=|S|$ and $s_{i}=\left|S_{i}\right|$ for $1 \leq i \leq n$. If $\mathcal{H}=\emptyset$, we obtain a $\operatorname{MOLS}(s)$. If $\mathcal{H}=\left\{S_{1}\right\}$, we simply write $\operatorname{IMOLS}\left(s, s_{1}\right)$ for the orthogonal pair of holey Latin squares.

If $\mathcal{H}=\left\{S_{1}, S_{2}, \cdots, S_{n}\right\}$ is a partition of $S$, then a holey Latin square is called a partitioned incomplete Latin square, denoted by PILS. The type of the PILS is defined to be the multiset $\left\{\left|S_{i}\right|: 1 \leq i \leq n\right\}$. We shall use an "exponential" notation to describe types: so type $t_{1}^{u_{1}} \cdots t_{k}^{u_{k}}$ denotes $u_{i}$ occurrences of $t_{i}, 1 \leq i \leq k$, in the multiset. Two orthogonal PILSs of type $T$ will be denoted by HMOLS $(T)$.

A holey Latin square is called self-orthogonal if it is orthogonal to its transpose. For self-orthogonal holey Latin squares we use the notations $\operatorname{SOLS}(s), \operatorname{ISOLS}\left(s, s_{1}\right)$ and $\operatorname{HSOLS}(\mathrm{T})$ for the cases of $\mathcal{H}=\emptyset,\left\{S_{1}\right\}$ and a partition $\left\{S_{1}, S_{2}, \cdots, S_{n}\right\}$, respectively. An HSOLS(T) is also denoted frame SOLS or FSOLS of type T. If $\mathcal{H}=\left\{S_{1}, S_{2}, \cdots, S_{n}, H\right\}$, where $\left\{S_{1}, S_{2}, \cdots, S_{n}\right\}$ is a partition of $S$, then the holey SOLS is called incomplete frame SOLS or an I-frame SOLS. The type of the I-frame SOLS is defined to be the multiset $\left\{\left(\left|S_{i}\right|,\left|S_{i} \cap H\right|\right): 1 \leq i \leq n\right\}$. We may also use an "exponential" notation to describe types of I-frame SOLS.

If $A, B, C$ are 3 MOLS such that $B=A^{T}$ and $C=C^{T}$, then $A$ is a self-orthogonal Latin square (SOLS) with $C$ a symmetric orthogonal mate (SOM). The set of $A, B, C$ is denoted SOLSSOM. If $C$ has constant diagonal, the SOLSSOM is called unipotent.

The existence problem for $\operatorname{ISOLS}(v, n)$ has been almost completely solved. The following is known (see [5],[6],[10]).

Theorem 1.1 There exists an $\operatorname{ISOLS}(v, n)$ for all values of $v$ and $n$ satisfying $v \geq$ $3 n+1$, except for $(v, n)=(6,1),(8,2)$ and possibly for $v=3 n+2, n \in\{4,6,8,10,14$, $16,18,20,22,26,28,32,34,46\}$.

In Section 2, we shall first give a direct construction for $\operatorname{ISOLS}(14,4)$ and then use it to solve ten other cases. This leaves only $n=6,8,10$ undecided. To do this some known results on HSOLS of certain types are useful. We collect them in the following.

Theorem 1.2 ([2], [7], [8]) For $h \geq 1$, there exists an $H S O L S\left(h^{n}\right)$ if and only if $n \geq 4,(h, n) \neq(1,6)$.

Theorem 1.3 ([9]) There exists an $\operatorname{HSOLS}\left(3^{n} u^{1}\right)$ if and only if $n \geq 4$ and $n \geq$ $1+\frac{2 u}{3}$, with seventeen possible exceptions $(n, u)=(5,1)$ and $(n, u)=\left(n, \frac{3 n}{2}-2\right)$ for $n \in\{6,10,14,18,22,30,34,38,42,46,54,58,62,66,70,94\}$.

In Section 4, we use the updated Theorem 1.1 to further improve Theorem 1.3. We solve twelve of the seventeen cases leaving five numbers between 6 and 22 undecided. To do this, two unipotent SOLSSOMs, SOLSSOM(66) and SOLSSOM(70) are useful; they are newly constructed in Section 3.

## 2 New ISOLS

The following $\operatorname{ISOLS}(14,4)$ is found by an exhaustive search using a computer.

| 0 | 6 | $w$ | 7 | $z$ | 3 | 8 | $x$ | 9 | $y$ | 5 | 4 | 2 | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $x$ | 1 | 7 | $z$ | 5 | $y$ | 2 | 4 | $w$ | 3 | 9 | 6 | 8 | 0 |
| 8 | $y$ | 2 | 9 | 7 | $w$ | $x$ | 6 | $z$ | 1 | 4 | 5 | 0 | 3 |
| $w$ | 7 | $x$ | 3 | 6 | 4 | 9 | 1 | $y$ | $z$ | 8 | 0 | 5 | 2 |
| 9 | $z$ | 0 | $y$ | 4 | 6 | 3 | 2 | $x$ | $w$ | 7 | 8 | 1 | 5 |
| 6 | 8 | 1 | $x$ | $w$ | 5 | $z$ | $y$ | 7 | 2 | 0 | 3 | 9 | 4 |
| $z$ | 9 | 8 | $w$ | $y$ | 0 | 6 | 5 | 3 | $x$ | 2 | 1 | 4 | 7 |
| 5 | $w$ | $z$ | 8 | $x$ | 2 | $y$ | 7 | 4 | 0 | 1 | 9 | 3 | 6 |
| $y$ | 5 | 3 | 0 | 1 | $x$ | $w$ | $z$ | 8 | 4 | 6 | 2 | 7 | 9 |
| 4 | $x$ | $y$ | 1 | 2 | $z$ | 0 | $w$ | 5 | 9 | 3 | 7 | 6 | 8 |
| 7 | 0 | 6 | 2 | 9 | 8 | 4 | 3 | 1 | 5 |  |  |  |  |
| 1 | 2 | 9 | 4 | 3 | 7 | 5 | 8 | 0 | 6 |  |  |  |  |
| 3 | 4 | 5 | 6 | 0 | 1 | 7 | 9 | 2 | 8 |  |  |  |  |
| 2 | 3 | 4 | 5 | 8 | 9 | 1 | 0 | 6 | 7 |  |  |  |  |

Lemma 2.1 There exists an $\operatorname{ISOLS}(14,4)$.
We shall use this ISOLS and some recursive constructions to solve other ten cases listed unknown in Theorem 1.1. We describe some known constructions below (see [10]).

Construction 2.2 Suppose a frame SOLS of type $t_{1}^{u_{1}} \cdots t_{k}^{u_{k}}$, and an $\operatorname{IMOLS}(m+$ $a, a)$ both exist. Then there exists an I-frame SOLS of type $\Pi_{1 \leq i \leq k}\left(t_{i}(m+a), t_{i} a\right)^{u_{i}}$.

Construction 2.3 Suppose there exists a frame SOLS of type $\left\{s_{i}: 1 \leq i \leq n\right\}$, and let $a \geq 0$ be an integer. For $1 \leq i \leq n-1$, suppose an $I S O L S\left(s_{i}+a, a\right)$ exists. Then there exists an $\operatorname{ISOLS}\left(s+a, s_{n}+a\right)$, where $s=\sum_{1 \leq i \leq n} s_{i}$.

Construction 2.4 Suppose an I-frame SOLS of type $\left\{\left(s_{i}, t_{i}\right): 1 \leq i \leq n\right\}$ exists, and let $a \geq 0$ be an integer. For $1 \leq i \leq n-1$, suppose there exists an $\operatorname{ISOLS}\left(s_{i}+\right.$ $\left.a ; t_{i}, a\right)$. Also, suppose an $\operatorname{ISOLS}\left(s_{n}+a, t_{n}\right)$ exists. Then there exists an $\operatorname{ISOLS}(s+$ $a, t)$, where $s=\sum s_{i}$ and $t=\sum t_{i}$.

The following known result is also needed.
Theorem 2.5 ([4]) There exists an $\operatorname{IMOLS}(v, n)$ for all values of $v$ and $n$ satisfying $v \geq 3 n$, except for $(v, n)=(6,1)$.
Lemma 2.6 There exists an $\operatorname{ISOLS}(44,14)$.
Proof. Start with an $\operatorname{HSOLS}\left(10^{4}\right)$ which exists from Theorem 1.2. Applying Construction 2.3 with $a=4$ gives an $\operatorname{ISOLS}(44,14)$. The required $\operatorname{ISOLS}(14,4)$ comes from Lemma 2.1.

The remaining nine cases can be treated uniformly.
Lemma 2.7 There exists an $\operatorname{ISOLS}(3 u+2 ; u, 2)$ for $u=3,4$.
Proof. An $\operatorname{ISOLS}(11 ; 3,2)$ is known, see [10, Table 4.1]. An $\operatorname{ISOLS}(14 ; 4,2)$ is shown below. The square is based on $\{0,1, \cdots, 9, a, b, x, y\}$ with two holes based on $\{8,9, a, b\}$ and $\{x, y\}$.

| 1 | 8 | 0 | $b$ | 6 | 9 | 4 | $a$ | $x$ | 7 | 3 | $y$ | 2 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $x$ | 2 | $b$ | 7 | 9 | 3 | $y$ | 5 | 1 | 0 | 6 | 4 | 8 | $a$ |
| 9 | 6 | 4 | $a$ | 1 | 8 | 0 | $b$ | 3 | $x$ | $y$ | 7 | 5 | 2 |
| 3 | 9 | $x$ | 5 | $y$ | 2 | $b$ | 7 | 6 | 4 | 1 | 0 | $a$ | 8 |
| $a$ | 5 | 3 | 9 | 7 | $b$ | 2 | 8 | 4 | $y$ | $x$ | 1 | 0 | 6 |
| 4 | $a$ | $y$ | 6 | $x$ | 0 | 8 | 1 | 5 | 3 | 7 | 2 | $b$ | 9 |
| 7 | $b$ | 8 | 2 | $a$ | 5 | 3 | 9 | $y$ | 1 | 4 | $x$ | 6 | 0 |
| $y$ | 0 | 1 | 8 | 4 | $a$ | $x$ | 6 | 7 | 2 | 5 | 3 | 9 | $b$ |
| 2 | $x$ | 7 | 0 | 3 | 6 | 5 | $y$ |  |  |  |  | 1 | 4 |
| 6 | 3 | 5 | $x$ | 2 | $y$ | 7 | 0 |  |  |  |  | 4 | 1 |
| 5 | 4 | 6 | $y$ | 0 | $x$ | 1 | 2 |  |  |  |  | 7 | 3 |
| 0 | $y$ | 2 | 1 | 5 | 4 | 6 | $x$ |  |  |  |  | 3 | 7 |
| 8 | 1 | $a$ | 4 | $b$ | 7 | 9 | 3 | 2 | 5 | 0 | 6 |  |  |
| $b$ | 7 | 9 | 3 | 8 | 1 | $a$ | 4 | 0 | 6 | 2 | 5 |  |  |

Lemma 2.8 If there is an $\operatorname{HSOLS}\left(3^{b} 4^{c} h^{1}\right)$ for $h=1,3,4,5$, then there exists an $\operatorname{ISOLS}(3 u+2, u)$ for $u=3 b+4 c+h$.
Proof. Start with an $\operatorname{HSOLS}\left(3^{b} 4^{c} h^{1}\right)$ and apply Construction 2.2 with $m=2$ and $a=$ 1 to obtain an I-frame SOLS of type $(9,3)^{b}(12,4)^{c}(3 h, h)^{1}$. The required $\operatorname{IMOLS}(3,1)$ comes from Theorem 2.5. Further apply Construction 2.4 with $a=2$. The required $\operatorname{ISOLS}(11 ; 3,2)$ and $\operatorname{ISOLS}(14 ; 4,2)$ come from Lemma 2.7; also ISOLS $(3 h+2, h)$ for $h=1,3,4,5$ come from Theorem 1.1 and Lemma 2.1. This gives an $\operatorname{ISOLS}(3 u+2, u)$ for $u=3 b+4 c+h$.

Lemma 2.9 There is an $\operatorname{ISOLS}(3 u+2, u)$ for $u \in\{16,18,20,22,26,28,32,34,46\}$. Proof. For each $u$, we have an $\operatorname{HSOLS}\left(3^{b} 4^{c} h^{1}\right)$ such that $u=3 b+4 c+h$. The HSOLS comes from either Theorem 1.2 or Theorem 1.3. The parameters are listed in Table 2.1. Then the conclusion follows from Lemma 2.8.

| $u$ | $b$ | $c$ | $h$ | $\operatorname{HSOLS}$ |
| :---: | :---: | :---: | :---: | :--- |
| 16 | 0 | 3 | 4 | $\operatorname{HSOLS}\left(4^{3} 4^{1}\right)$ |
| 18 | 5 | 0 | 3 | $\operatorname{HSOLS}\left(3^{3} 3^{1}\right)$ |
| 20 | 0 | 4 | 4 | $\operatorname{HSOLS}\left(4^{4} 4^{1}\right)$ |
| 22 | 6 | 0 | 4 | $\operatorname{HSOLS}\left(3^{6} 4^{1}\right)$ |
| 26 | 7 | 0 | 5 | $\operatorname{HSOLS}\left(3^{7} 5^{1}\right)$ |
| 28 | 8 | 0 | 4 | $\operatorname{HSOLS}\left(3^{8} 4^{1}\right)$ |
| 32 | 0 | 7 | 4 | $\operatorname{HSOLS}\left(4^{7} 4^{1}\right)$ |
| 34 | 10 | 0 | 4 | $\operatorname{HSOLS}\left(3^{10} 4^{1}\right)$ |
| 46 | 15 | 0 | 1 | $\operatorname{HSOLS}\left(3^{15} 1^{1}\right)$ |

## Table 2.1

We can now update Theorem 1.1 as follows.
Theorem 2.10 There exists an $\operatorname{ISOLS}(v, n)$ for all values of $v$ and $n$ satisfying $v \geq 3 n+1$, except for $(v, n)=(6,1),(8,2)$ and possibly for $v=3 n+2, n \in\{6,8,10\}$.

## 3 New SOLSSOMs

It is known that a unipotent SOLSSOM of order $n$ exists if and only if $n$ is even and $n \geq 4$ with one exception of $n=6$ and four possible exceptions of $n=10,14,66,70$ (see [3], [1]). In this section, we shall construct two new SOLSSOMs of orders 66 and 70 , which are also unipotent. They are useful in the next section.

The following direct construction is based on difference methods, which is a modification of Lemma 2.1 in [8].

Lemma 3.1 Let $G=Z_{g}$ with $g$ even, and let $X$ be any set disjoint from $G,|X|=h$ is even. Suppose there exists a set of 5 -tuples $\mathcal{B} \subseteq(G \cup X)^{5}$ which satisfies the following properties:

1. for each $i, 1 \leq i \leq 5$, and each $x \in X$, there is a unique $B \in \mathcal{B}$ with $b_{i}=x$ ( $b_{i}$ denotes the $i$-th co-ordinate of $B$ );
2. no $B \in \mathcal{B}$ has two co-ordinates in $X$;
3. for each $i, j(1 \leq i<j \leq 5)$ and each $d \in G$, there is a unique $B \in \mathcal{B}$ with $b_{i}, b_{j} \in G$ and $b_{i}-b_{j}=d(\bmod g) ;$
4. for $b_{5} \in G,\left(b_{1}, b_{2}, b_{3}, b_{4}, b_{5}\right) \in \mathcal{B}$ if and only if $\left(b_{2}, b_{1}, b_{4}, b_{3}, b_{5}\right) \in \mathcal{B}$;
5. the differences $b_{1}-b_{2}, b_{3}-b_{4}(\bmod g)$ are both odd if $\left(b_{1}, b_{2}, b_{3}, b_{4}, x\right)$ and $\left(b_{2}, b_{1}, b_{4}, b_{3}, y\right)$ are both in $\mathcal{B}$ for any $x, y \in X, x \neq y$;
6. $(0,0,0,0, x) \in \mathcal{B}$ for some $x \in X$ and $\left(0, \frac{g}{2}, a, a+\frac{g}{2}, y\right) \in \mathcal{B}$ for some $a \in G$ and some $y \in X$.
Then there exists an $\operatorname{ISOLSSOM}(g+h, h)$. If further a unipotent $\operatorname{SOLSSOM}(h)$, exists, then so does a unipotent SOLSSOM $(g+h)$.

Proof. From the first four properties, we can obtain an $\operatorname{ISOLS}(g+h, h)$ with an orthogonal mate. In fact, by developing $\mathcal{B}$ through $G$ and using the first two coordinates as row and column indices, the squares from the last three co-ordinates are orthogonal to each other. The first square has the second square as its transpose and therefore is an ISOLS.

The third square is almost symmetric except when cell $\left(b_{1}, b_{2}\right)$ contains $x \in X$ while cell $\left(b_{2}, b_{1}\right)$ contains $y \in X, x \neq y$. Since the difference $b_{1}-b_{2}$ is odd, we can make the following adjustment to obtain a symmetric square: replace $x$ by $y$ for cells $\left(b_{1}+t, b_{2}+t\right)$ when $t$ is odd; and also replace $y$ by $x$ for cells $\left(b_{2}+t, b_{1}+t\right)$ when $t$ is even. Since the difference $b_{3}-b_{4}$ is also odd, such adjustment will not damage the orthogonality between the first and the third squares.

If we construct a unipotent $\operatorname{SOLSSOM}(h)$ based on $X$ and fill it in the size $h$ hole, we obtain a SOLSSOM $(g+h)$. Since $\mathcal{B}$ contains $(0,0,0,0, x)$ for some $x \in X$, we may suppose that the third square of $\operatorname{SOLSSOM}(h)$ has constant diagonal $x$ so that the third square of $\operatorname{SOLSSOM}(g+h)$ also has constant diagonal $x$.

In what follows, we take $h=16$. As mentioned above, there exists a unipotent SOLSSOM(16).

Lemma 3.2 There is a unipotent SOLSSOM(66).
Proof. Let $G=Z_{50}$ and let $X=\left\{x_{1}, \cdots, x_{8}, y_{1}, \cdots, y_{8}\right\}$. We use the above direct construction and list about half the members of $\mathcal{B}$ as follows. For $e \in G$, each column ( $a, b, c, d, e$ ) generates another column ( $b, a, d, c, e$ ). For $e=x_{i}, i=2, \cdots, 8$, each column ( $a, b, c, d, x_{i}$ ) generates another column ( $b, a, d, c, y_{i}$ ). The last two columns do not generate another one. We thus obtain 82 columns forming the set $\mathcal{B}$. It is readily checked that the conditions in Lemma 3.1 are satisfied; hence a unipotent SOLSSOM(66) exists.

| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ | $x_{7}$ | $x_{8}$ | $y_{1}$ | $y_{2}$ | $y_{3}$ | $y_{4}$ | $y_{5}$ | $y_{6}$ | $y_{7}$ | $y_{8}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ | $x_{7}$ | $x_{8}$ | $y_{1}$ | $y_{2}$ | $y_{3}$ | $y_{4}$ | $y_{5}$ | $y_{6}$ | $y_{7}$ | $y_{8}$ |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 21 |  | 0 | 0 |  |  |  |  |
| 17 | 7 | 5 | 11 | 9 | 15 | 1 |  | 49 |  | 0 | 25 |  |  |  |  |
| 33 | 19 | 27 | 18 | 22 | 12 | 44 |  | 30 | 0 | 26 |  |  |  |  |  |
| 46 | 18 | 20 | 3 | 17 | 39 | 11 | 19 | 0 | 1 |  |  |  |  |  |  |
| $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ | $x_{7}$ | $x_{8}$ |  | 0 |  | $x_{1}$ | $y_{1}$ |  |  |  | $\square$ |

Lemma 3.3 There is a unipotent SOLSSOM(70).
Proof. Let $G=Z_{54}$ and let $X$ be as in the previous lemma. We list about half of the members of $\mathcal{B}$ similar to the previous lemma. We obtain 86 columns forming the set $\mathcal{B}$. The conditions in Lemma 3.1 are again satisfied; hence a unipotent SOLSSOM(70) exists.

| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ | $x_{7}$ | $x_{8}$ | $y_{1}$ | $y_{2}$ | $y_{3}$ | $y_{4}$ | $y_{5}$ | $y_{6}$ | $y_{7}$ | $y_{8}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 23 | 32 | 25 | 0 | 51 | 36 | 37 | 31 | 48 | 19 | 30 | 28 | 38 | 49 | 47 | 3 |
| 11 | 21 | 1 | 15 | 47 | 20 | 0 | 25 | 4 | 32 | 51 | 46 | 35 | 53 | 12 | 17 |
| 24 | 19 | 29 | 45 | 41 | 28 | 10 | 37 | 44 | 16 | 33 | 26 | 40 | 2 | 5 | 38 |

Regarding the existence of unipotent SOLSSOMs, we can now update the known results in the following.

Theorem 3.4 A unipotent SOLSSOM( $n$ ) exists if and only if $n \geq 4$ is even, except for $n=6$ and possibly for $n=10,14$.

## 4 New HSOLS

In this section, we shall improve Theorem 1.3 by deleting twelve unknown cases. First we give an $\operatorname{HSOLS}\left(3^{5} 1^{1}\right)$ below, which is found by general computer search. The HSOLS is based on $\{0, \cdots, 14, x\}$ with holes $\{x\}$ and $\{i, 5+i, 10+i\}$ for $0 \leq i \leq 4$. We replace $10,11,12,13,14$ by $a, b, c, d, e$, respectively.

Lemma 4.1 There exists an $\operatorname{HSOLS}\left(3^{5} 1^{1}\right)$.
We can treat the remaining eleven cases uniformly. A transversal of a holey Latin square of order $n$ is a set of $n$ cells in which the $n$ entries are all distinct. For a transversal $T$, suppose $(i, j) \in T$ if and only if $(j, i) \in T$, then $T$ is called symmetric. For a pair of transversals $T$ and $T^{\prime}$, suppose $(i, j) \in T$ if and only if $(j, i) \in T^{\prime}$, then the pair is called symmetric. We can now state a known construction, see [ 9 , Construction 2.5].

|  | 3 | 6 | $e$ | $b$ |  | 9 | $d$ | 2 | $x$ |  | 8 | 4 | 7 | 1 | $c$ |

| $e$ | $c$ | $d$ | 2 | 0 | 1 | 5 | 3 | 4 | 8 | 6 | 7 | $b$ | 9 | $a$ |  |

Construction 4.2 Suppose there is an $\operatorname{HSOLS}\left(t^{n}\right)$ which has $p+2 q$ disjoint transversals, $p$ of them being symmetric and the rest being $q$ symmetric pairs. For $1 \leq i \leq p$ and $1 \leq j \leq q$, let $v_{i} \geq 0$ and $w_{j} \geq 0$ be integers. Let $s$ and $h$ be positive integers, where sh$\neq 2$ or 6 if $p+2 q<t(n-1)$. Suppose there exist $\operatorname{HMOLS}\left(s^{h} v_{i}^{1}\right)$ for $1 \leq i \leq p$, HSOLS $\left(s^{h} w_{j}^{1}\right)$ for $1 \leq j \leq q$ and $\operatorname{HSOLS}\left(s^{t n} k^{1}\right)$. Then there exists an HSOLS $\left((t s h)^{n} u^{1}\right)$, where $u=k+\sum v_{i}+2 \sum w_{j}$.

For a unipotent SOLSSOM, each element in the symmetric orthogonal mate determines a symmetric transversal in the SOLS. Especially, the main diagonal is one of such symmetrical transversals. Thus, we have the following.

Lemma 4.3 If a unipotent SOLSSOM(n) exists, then an HSOLS $\left(1^{n}\right)$ having $n-1$ disjoint symmetric transversals also exists.

Lemma 4.4 For even $n$, if there exist a unipotent $\operatorname{SOLSSOM}(n)$ and an ISOLS $\left(\frac{3 n}{2}-1, \frac{n}{2}-1\right)$, then there exists an HSOLS $\left(3^{n} u^{1}\right)$, where $u=\frac{3 n}{2}-2$.

Proof. From a unipotent $\operatorname{SOLSSOM}(n)$, we have by Lemma 4.3 an $\operatorname{HSOLS}\left(1^{n}\right)$ having $n-1$ disjoint symmetric transversals. Apply Construction 4.2 with $t=1, p=n-1$ and $q=0$. Let $s=1, h=3$ and $v_{i}=1$ for $1 \leq i \leq p$. A unipotent SOLSSOM(4) leads to an $\operatorname{HSOLS}\left(1^{4}\right)$, also an $\operatorname{HMOLS}\left(1^{4}\right)$. For $k=\frac{n}{2}-1$, an $\operatorname{HSOLS}\left(1^{n} k^{1}\right)$ exists from the given $\operatorname{ISOLS}(n+k, k)$. By Construction 4.2, we obtain an $\operatorname{HSOLS}\left(3^{n} u^{1}\right)$, where $u=k+\sum v_{i}=\frac{3 n}{2}-2$.

Lemma 4.5 There exists an $\operatorname{HSOLS}\left(3^{n}\left(\frac{3 n}{2}-2\right)^{1}\right)$ for $n \in\{30,34,38,42,46,54,58$, $62,66,70,94\}$.

Proof. For the given $n$, there exist a unipotent $\operatorname{SOLSSOM}(n)$ from Theorem 3.4 and an ISOLS $\left(\frac{3 n}{2}-1, \frac{n}{2}-1\right)$ from Theorem 2.10. The conclusion follows from Lemma 4.4. -

We can now update Theorem 1.3 as follows.
Theorem 4.6 There exists an $\operatorname{HSOLS}\left(3^{n} u^{1}\right)$ if and only if $n \geq 4$ and $n \geq 1+\frac{2 u}{3}$, with five possible exceptions $(n, u)=\left(n, \frac{3 n}{2}-2\right)$ for $n \in\{6,10,14,18,22\}$.
