#### Abstract

In this paper, necessary and sufficient conditions are found for the existence of a 2 -colourable $K_{4}-e$ design of $\lambda K_{3}$.

## 1. Introduction.

Let $G$ be a simple graph; i.e., a subgraph of $K_{n}$ (the complete undirected graph on $n$ vertices). A $\lambda$-fold $G$-design (of order $n$ ) is a pair ( $P, B$ ), where $B$ is an edgedisjoint decomposition of $\lambda K_{n}\left(\lambda\right.$ copies of $\left.K_{n}\right)$ with vertex set $P$ into copies of the graph $G$. The number $n$ is called the order of the $G$-design $(P, B)$ and, of course, $|B|=\lambda\binom{n}{2} /|E(G)|$ where $|E(G)|$ is the number of edges belonging to $G$. When $\lambda=1$

[^0]triple system is a $K_{3}$-design and a block design with block size 4 is a $K_{4}$-design.

Now let $(P, B)$ be a $\lambda$-fold $G$-design. The subset $X$ of $P$ is called a 2 -colouring of $(P, B)$ if and only if for each $g \in B, V(g) \cap X \neq \emptyset$ and $V(g) \cap(P \backslash X) \neq \emptyset$, where $V(g)$ is the vertex set of the graph $g$. (The subset $X$ is also called a blocking set. However, in what follows we will stick with calling $X$ a 2 -colouring rather than a blocking set.)

It is quite easy to see that the only $\lambda$-fold $K_{3}$-designs admitting a 2 -colouring have orders 3 or 4 (regardless of $\lambda$ ). See [6] for example. Things are considerably different for $\lambda$-fold $K_{4}$-designs. In a series of two papers [4, 5] D. G. Hoffman, C. C. Lindner, and K. T. Phelps gave a complete solution (modulo a handful of possible exceptions) of the problem of constructing $\lambda$-fold $K_{4}$-designs which can be 2 coloured. In particular, the combined work in [4, 5] guarantees the existence of a $\lambda$-fold $K_{4}$-design of order $n$ which can be 2 -coloured for every admissible $(n, \lambda)$ except possibly for $(n \in\{37,40,73\}, \lambda=1),(n=37, \lambda \equiv 1$ or $5(\bmod 6) \geq 5)$, and $(n \in\{19,34,37,46,58\}, \lambda \equiv 2$ or $4(\bmod 6))$. In a forthcoming paper, necessary and sufficient conditions are found for the existence of a 2-colourable $G$-design of $K_{n}$ for all connected, simple graphs $G$ with at most 5 edges, $G \neq K_{4}-e[2]$.

The purpose of this paper is to give a complete solution of the existence problem of $\lambda$-fold $K_{4}-e$ designs which admit a 2 -colouring, where

Clearly the spectrum for $\lambda$-fold $K_{4}-e$ designs is contained in the set of all (i) $n \equiv 0$ or $1(\bmod 5) \geq 6$ for $\lambda=1$, (ii) $n \equiv 0$ or $1(\bmod 5)$ for $\lambda \equiv 1,2,3$, or $4(\bmod 5) \geq 2$, and (iii) $n \geq 4$ for $\lambda \equiv 0(\bmod 5)$. We show that these necessary conditions are not only sufficient for the existence of a $\lambda$-fold $K_{4}-e$ design but for the existence of a $\lambda$-fold $K_{4}-e$ design which can be 2 -coloured as well. Here goes!

In what follows we will denote

by any one of $(a, b, c, d),(a, b, d, c),(b, a, c, d)$, or $(b, a, d, c)$.

To begin with it is trivial to see that there does not exist a $K_{4}-e$ design of order 5. Now for some necessary examples.

Example 2.1. The following are examples of $K_{4}-e$ designs $(\lambda=1)$, which can be 2 -coloured.

$$
n=6
$$

| 1 | 4 | 2 | 5 |
| :--- | :--- | :--- | :--- |
| 2 | 5 | 3 | 6 |
| 3 | 6 | 1 | 4 |

2 colouring $\{1,2,3\}$

$$

| $(j, 0),(j, 4), \infty_{3}, \infty_{8}$ | $(j, 1),(j, 4), \infty_{5}, \infty_{10}$ |  |
| $j \in Z_{2}(\bmod 2)$ |  |  |
| $(0,5),(1,5), \infty_{1}, \infty_{6}$ | $(0,2),(1,2), \infty_{5}, \infty_{10}$ |  |
| $(0,0),(1,0), \infty_{2}, \infty_{7}$ | $(0,3),(1,3), \infty_{5}, \infty_{10}$ |  |
| $(0,1),(1,1), \infty_{3}, \infty_{8}$ | $(0,6),(1,6), \infty_{5}, \infty_{10}$ |  |
| $(0,4),(1,4), \infty_{4}, \infty_{9}$ |  |  |

2 -colouring $\left\{\infty_{0}, \infty_{1}, \infty_{2}, \infty_{3}, \infty_{4}, \infty_{5}\right\} \cup\left\{(0, i) \mid i \in Z_{7}\right\}$
With the above examples in hand we proceed to the main constructions for $K_{4}-e$ designs.

The $10 k$ Construction. Let $(X, \circ)$ be a quasigroup and $H=\left\{h_{1}, h_{2}, \ldots, h_{m}\right\}$ a partition of $X$. The subsets $h_{i} \in H$ are called holes. If for each hole $h_{i} \in H,\left(h_{i}, 0\right)$ is a subquasigroup of $(X, 0)$, then $(X, 0)$ is called a quasigroup with holes $H$. Let $(X, \circ)$ be a commutative quasigroup of order $2 k$ with holes $H$ all of size 2 . Set $P=X \times\{1,2,3,4,5\}$ and define a collection of graphs $B$ as follows: (1) For each hole $h \in H$, let $\left(h \times\{1,2,3,4,5\}, h^{*}\right)$ be the $K_{4}-e$ design order 10 in Example 2.1 with 2 -colouring $h \times\{1,2\}$ and place the graphs of $h^{*}$ in $B$, and
(2) if $x$ and $y$ belong to different holes of $H$, place the 5 graphs

$$
\begin{aligned}
& ((x, 1),(y, 1),(x \circ y, 2),(x \circ y, 4)), \\
& ((x, 2),(y, 2),(x \circ y, 3),(x \circ y, 5)), \\
& ((x, 3),(y, 3),(x \circ y, 4),(x \circ y, 1)), \\
& ((x, 4),(y, 4),(x \circ y, 5),(x \circ y, 2)) \text {, and } \\
& ((x, 5),(y, 5),(x \circ y, 1),(x \circ y, 3)) \text { in } B .
\end{aligned}
$$

Then $(P, B)$ is a $K_{4}-e$ design of order $10 k$ and $X \times\{1,2\}$ is a 2 -colouring.

The $10 k+1$ Construction. In the $10 k$ Construction set $P=\{\infty\} \cup(X \times$ $\{1,2,3,4,5\}$ ) and replace (1) by: For each hole $h_{i} \in H$, let

$$
\left(\{\infty\} \cup\left(h_{i} \times\{1,2,3,4,5\}\right), h_{\boldsymbol{i}}^{*}\right)
$$

be the $K_{4}-e$ design of order 11 in Example 2.1 with 2 -colouring $h_{i} \times\{1,2,3\}$, and place the graphs of $h_{i}^{*}$ in $B$.

Then $(P, B)$ is a $K_{4}-e$ design of order $10 k+1$ and $X \times\{1,2,3\}$ is a 2 -colouring.

The $10 k+5$ Construction. In the $10 k$ Construction set

$$
P=\left\{\infty_{1}, \infty_{2}, \infty_{3}, \infty_{4}, \infty_{5}\right\} \cup(X \times\{1,2,3,4,5\})
$$

and replace (1) by: (i) for the hole $h_{1}$, let
be the $K_{4}-e$ design of order 15 in Example 2.1 with the 2 -colouring $h_{1} \times\{1,2,3\}$ and place the graphs of $h_{1}^{*}$ in $B$, and (ii) for each of the holes $h_{2}, h_{3}, \ldots, h_{k}$, let $\left(\left\{\infty_{1}, \infty_{2}, \infty_{3}, \infty_{4}, \infty_{5}\right\} \cup\left(h_{i} \times\{1,2,3,4,5\}\right), h_{i}^{*}\right)$ be the $K_{4}-e$ design of order 15 with hole $=\left\{\infty_{1}, \infty_{2}, \infty_{3}, \infty_{4}, \infty_{5}\right\}$ in Example 2.1 with 2 -colouring $h_{i} \times\{1,2,3\}$ and place the graphs of $h_{i}^{*}$ in $B$.

Then $(P, B)$ is a $K_{4}-e$ design of order $10 k+5$ and $X \times\{1,2,3\}$ is a 2-colouring.

The $10 k+6$ Construction. Let $(X, 0)$ be an idempotent $\left(x^{2}=x\right)$ and commutative quasigroup of order $2 k+1$, set $P=\{\infty\} \cup(X \times\{1,2,3,4,5\})$, and define a collection of graphs $B$ as follows:
(1) For each $a \in X$, let $\left(\{\infty\} \cup(\{a\} \times\{1,2,3,4,5\}), a^{*}\right)$ be the $K_{4}-e$ design of order 6 in Example 2.1 with 2 -colouring $\{a\} \times\{1,2,3\}$, and place the 6 graphs of $a^{*}$ in $B$, and
(2) the same as the $10 k$ Construction.

Then $(P, B)$ is a $K_{4}-e$ design of order $10 k+6$ and $X \times\{1,2,3\}$ is a 2 -colouring.
We can now combine the examples in Example 2.1 and the above four constructions to determine the spectrum of $K_{4}-e$ designs which can be 2-coloured.

Theorem 2.2. The spectrum of $K_{4}-e$ designs which can be 2-coloured is precisely the set of all $n=0$ or $1(\bmod 5) \geq 6$.

Proof: It is well-known (see [3, 7], for example) that the spectrum for commutative quasigroups of order $2 k$ with holes all of size 2 is precisely the set of all $2 k \geq 6$. Hence if $n=10 k, 10 k+1$, or $10 k+5 \geq 30$, the $10 k, 10 k+1$, and $10 k+5$ Constructions produce a $K_{4}-e$ design which can be 2 -coloured. If $n=10 k+6 \geq 16$, the $10 k+6$ Construction produces a $K_{4}-e$ design which can be 2 -coloured. The cases $n=6,10,11,15,20,21$ and 25 are taken care of in Example 2.1.
3. $\lambda \equiv 1,2,3$ or $4(\bmod 5)$.

As noted in Section 1, it is obvious that the spectrum for $\lambda$-fold $K_{4}-e$ designs for $\lambda \equiv 1,2,3$ or $4(\bmod 5) \geq 2$ is contained in the set of all $n \equiv 0$ or $1(\bmod 5)$. Hence to settle the existence problem for $\lambda$-fold $K_{4}-e$ designs when $\lambda \equiv 1,2,3$, or $4(\bmod$ 5) $\geq 2$ we need to take care of the case $n=5$ only, since we can just take $\lambda$ copies of a $K_{4}-e$ design of order $n \geq 6$ (admitting a 2 -colouring) in every other case. The following two examples dispose of $\lambda$-fold $K_{4}-e$ designs of order 5 (which can be 2 -coloured) for all $\lambda \equiv 1,2,3$ or $4(\bmod 5) \geq 2$.

Example 3.1.

$$
\begin{array}{lc}
n=5 \text { and } \lambda=2 . & n=5 \text { and } \lambda=3 . \\
\begin{array}{|cccc}
1 & 2 & 3 & 4 \\
3 & 5 & 2 & 4 \\
1 & 2 & 4 & 5 \\
3 & 5 & 1 & 4 \\
\hline
\end{array} & \begin{array}{|cccc}
5 & 1 & 2 & 3 \\
5 & 2 & 3 & 4 \\
5 & 3 & 4 & 1 \\
5 & 4 & 1 & 2 \\
1 & 3 & 2 & 4 \\
2 & 4 & 1 & 3 \\
\hline
\end{array} \\
\text { 2-colouring }\{1,2\}
\end{array}
$$

Theorem 3.2. The spectrum of $\lambda$-fold $K_{4}-e$ designs with $\lambda \equiv 1,2,3$ or $4(\bmod 5)$ $\geq 2$ which can be 2 -coloured is precisely the set of all $n \equiv 0$ or $1(\bmod 5)$.
4. $\lambda \equiv 0(\bmod 5)$.

The spectrum for $\lambda$-fold $K_{4}-e$ designs for $\lambda \equiv 0(\bmod 5)$ is precisely the set of all $n \geq 4$. The following Folk Construction packs the spectrum.

Folk Construction. Let ( $P, \circ$ ) be an idempotent anti-symmetric ( $a \circ b \neq b \circ a, a \neq$ $b \in P)$ quasigroup of order $n \geq 4$. Let $B=\{(a, b, a \circ b, b \circ a) \mid$ all $a \neq b \in P\}$. Then $(P, B)$ is a 5 -fold $K_{4}-e$ design. Taking $k$ copies of $(P, B)$ produces a $5 k$-fold $K_{4}-e$ design of order $n$.
galore, it is not apparent (at least not to the authors) how to 2 -colour such designs. So, in order to pack the spectrum with $\lambda$-fold $K_{4}-e$ designs, $\lambda \equiv 0(\bmod 5)$, which can be 2 -coloured we take the following tack. We 2 -colour a handful of idempotent anti-symmetric quasigroups of small orders, and use these 5 -fold $K_{4}-e$ designs in five different recursive constructions: $n \equiv 0,1,2,3$, and $4(\bmod 5)$, with $\lambda=5$.

The cases $n \equiv 0$ or $1(\bmod 5)$ are taken care of by Theorem 2.2 (just take 5 copies of a $K_{4}-e$ design), with the exception of $n=5$. It is less than trivial to 2 -colour an idempotent anti-symmetric quasigroup of order 5 . So much for $n \equiv 0$ or $1(\bmod 5)$. We now move on to the cases $n=2,3$, and $4(\bmod 6), \lambda=5$.

Example 4.1. The following four examples are necessary for the $n \equiv 2(\bmod 5)$ constructions.
$n=7$.

| $\mathrm{o}_{1}$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | 6 | 4 | 2 | 7 | 5 | 3 |
| 2 | 4 | 2 | 7 | 5 | 3 | 1 | 6 |
| 3 | 7 | 5 | 3 | 1 | 6 | 4 | 2 |
| 4 | 3 | 1 | 6 | 4 | 2 | 7 | 5 |
| 5 | 6 | 4 | 2 | 7 | 5 | 3 | 1 |
| 6 | 2 | 7 | 5 | 3 | 1 | 6 | 4 |
| 7 | 5 | 3 | 1 | 6 | 4 | 2 | 7 |
|  |  |  |  |  |  |  |  |

2-colouring $\{1,2,3,5\}$
$n=7($ with hole $=\{1,2\})$.

| $\circ_{2}$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 10 | 9 | 11 | 4 | 8 | 12 | 5 | 2 | 1 | 6 | 10 | 3 | 7 |
| 11 | 3 | 8 | 12 | 5 | 9 | 1 | 6 | 10 | 2 | 7 | 11 | 4 |
| 12 | 8 | 5 | 9 | 1 | 6 | 10 | 3 | 7 | 11 | 4 | 2 | 12 |

The $10 k+7$ Construction. Let $(X, 0)$ be an idempotent commutative quasigroup of order $2 k+1, \operatorname{set} P=\left\{\infty_{1}, \infty_{2}\right\} \cup(X \times\{1,2,3,4,5\})$, and define a collection of graphs $B$ as follows :
(1) Let $a \in X$, and let $\left(\left\{\infty_{1}, \infty_{2}\right\} \cup(\{a\} \times\{1,2,3,4,5\}), a^{*}\right)$ be the 5 -fold $K_{4}-e$ design of order 7 defined by $o_{1}$ in Example 4.1 with 2 -colouring $\left\{\infty_{1}, \infty_{2}\right\} \cup(\{a\} \times$ $\{1,2\}$ ), and place the 21 graphs of $a^{*}$ in $B$;
(2) for each $b \in X \backslash\{a\}$, let $\left(\left\{\infty_{1}, \infty_{2}\right\} \cup\left(\{b\} \times\{1,2,3,4,5\}, b^{*}\right)\right.$ be the 5 -fold $K_{4}-e$ design of order 7 with hole $\left\{\infty_{1}, \infty_{2}\right\}$ defined by $o_{2}$ in Example 4.1 with 2 -colouring $\left\{\infty_{1}, \infty_{2}\right\} \cup(\{b\} \times\{1,2\})$ and place the 20 graphs in $b^{*}$ in $B$; and
(3) if $x \neq y \in X$, place 5 copies of each of the graphs

$$
\begin{aligned}
& ((x, 1),(y, 1),(x \circ y, 2),(x \circ y, 4)), \\
& ((x, 2),(y, 2),(x \circ y, 3),(x \circ y, 5)), \\
& ((x, 3),(y, 3),(x \circ y, 4),(x \circ y, 1)), \\
& ((x, 4),(y, 4),(x \circ y, 5),(x \circ y, 2)), \text { and } \\
& ((x, 5),(y, 5),(x \circ y, 1),(x \circ y, 3)) \text { in } B .
\end{aligned}
$$

Then $(P, B)$ is a 5 -fold $K_{4}$-e design of order $10 k+7$ and $\left\{\infty_{1}, \infty_{2}\right\} \cup(X \times\{1,2\})$ is a 2 -colouring.

The $10 k+2$ Construction. Let $(X, o)$ be a commutative quasigroup of order $2 k$ with holes $H=\left\{h_{1}, h_{2}, \ldots, h_{k}\right\}$ all of size 2 , set $P=\left\{\infty_{1}, \infty_{2}\right\} \cup(X \times\{1,2,3,4,5\})$, and define a collection of graphs $B$ as follows:
(1) For the hole $h_{1}$, let $\left(\left\{\infty_{1}, \infty_{2}\right\} \cup\left(h_{1} \times\{1,2,3,4,5\}\right), h_{1}^{*}\right)$ be the 5 -fold $K_{4}-e$ design of order 12 defined by $o_{3}$ in Example 4.1 with 2 -colouring $h_{1} \times\{1,2,3\}$, an d place the 66 graphs of $h_{1}^{*}$ in $B$;
(2) for each of the remaining holes $h_{2}, h_{3}, h_{4}, \ldots, h_{k}$, let

$$
\left(\left\{\infty_{1}, \infty_{2}\right\} \cup\left(h_{i} \times\{1,2,3,4,5\}\right), h_{i}^{*}\right)
$$

be the 5 -fold $K_{4}$-e design of order 12 with hole $\left\{\infty_{1}, \infty_{2}\right\}$ defined by $o_{4}$ in Example 4.1 with 2 -colouring $h_{i} \times\{1,2,3\}$ and place the 65 graphs in $h_{i}^{*}$ in $B$; and
(3) the same as (3) in the $10 k+7$ Construction.

Then $(P, B)$ is a 5 -fold $K_{4}-e$ design of order $10 k+2$ and $X \times\{1,2,3\}$ is a 2-colouring.

2-colouring $\{4,5,6,8,9,10\}$
The $10 k+8$ Construction. In the $10 k+7$ Construction, set

$$
P=\left\{\infty_{1}, \infty_{2}, \infty_{3}\right\} \cup(X \times\{1,2,3,4,5\})
$$

and use the quasigroups of order 8 defned by $o_{1}$ and $o_{2}$ in Example 4.2 with 2 colourings $\left\{\infty_{1}, \infty_{2}\right\} \cup(\{a\} \times\{1,2\})$ and $\left\{\infty_{1}, \infty_{2}\right\} \cup(\{b\} \times\{1,2\})$.

Then $(P, B)$ is a 5 -fold $K_{4}-e$ design of order $10 k+8$ and $\left\{\infty_{1}, \infty_{2}\right\} \cup(X \times\{1,2\})$ is a 2 -colouring.

The $10 k+3$ Construction. In the $10 k+2$ Construction, set

$$
P=\left\{\infty_{1}, \infty_{2}, \infty_{3}\right\} \cup(X \times\{1,2,3,4,5\})
$$

and use the quasigroups of order 13 defined by $o_{3}$ and $o_{4}$ in Example 4.2 with 2 colourings $h_{1} \times\{1,2,3\}$ and $h_{i} \times\{1,2,3\}(i \geq 2)$.

Then $(P, B)$ is a 5 -fold $K_{4}-e$ design of order $10 k+3$ and $X \times\{1,2,3\}$ is a 2-colouring.

Example 4.3. The following examples are necessary for the tollowing $n \equiv 4$ (mod
5) constructions.
$\underline{n}=9$ (and $\mathrm{n}=9$ with hole $=\{1,2,3,4\}$ ).

| $\circ_{1}$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 3 | 4 | 2 | 6 | 7 | 8 | 9 | 5 |

| 5 | 10 | 12 | 9 | 11 | 5 | 2 | 8 | 1 | 3 | 14 | 13 | 6 | 4 | 7 |
| 6 | 8 | 7 | 11 | 5 | 12 | 6 | 13 | 14 | 1 | 4 | 9 | 2 | 3 | 10 |
| 7 | 14 | 13 | 10 | 12 | 3 | 4 | 7 | 9 | 8 | 1 | 2 | 5 | 6 | 11 |
| 8 | 13 | 5 | 7 | 9 | 2 | 11 | 3 | 8 | 4 | 6 | 14 | 10 | 1 | 12 |
| 9 | 6 | 10 | 5 | 8 | 13 | 14 | 1 | 12 | 9 | 7 | 3 | 4 | 11 | 2 |
| 10 | 9 | 6 | 14 | 7 | 8 | 1 | 11 | 3 | 2 | 10 | 12 | 13 | 5 | 4 |
| 11 | 12 | 8 | 13 | 14 | 10 | 3 | 4 | 6 | 5 | 2 | 11 | 7 | 9 | 1 |
| 12 | 11 | 14 | 8 | 6 | 4 | -7 | 9 | 5 | 10 | 3 | 1 | 12 | 2 | 13 |
| 13 | 7 | 9 | 6 | 10 | 11 | 12 | 5 | 2 | 14 | 8 | 4 | 1 | 13 | 3 |
| 14 | 5 | 11 | 12 | 13 | 1 | 8 | 2 | 4 | 7 | 9 | 6 | 3 | 10 | 14 |

The $10 k+9$ Construction. In the $10 k+7$ Construction set $P=\left\{\infty_{1}, \infty_{2}, \infty_{3}, \infty_{4}\right\} \cup$ ( $X \times\{1,2,3,4,5\}$ ) and use the quasigroup of order 9 defined by $o_{1}$ in Example 4.3 with 2-colourings $\left\{\infty_{1}\right\} \cup(\{a\} \times\{1,2,3\})$ and $\left\{\infty_{1}\right\} \cup(\{b\} \times\{1,2,3\})$.

Then $(P, B)$ is a 5 -fold $K_{4}-e$ design of order $10 k+9$ and $\left\{\infty_{1}\right\} \cup(X \times\{1,2,3\})$ is a 2 -colouring.

The $10 k+4$ Construction. In the $10 k+2$ Construction set $P=\left\{\infty_{1}, \infty_{2}, \infty_{3}, \infty_{4}\right\} \cup$ $(X \times\{1,2,3,4,5\})$ and use the quasigroup of order 14 defined by $o_{2}$ in Example 4.3 with 2-colouring $\left\{\infty_{1}\right\} \cup\left(h_{1} \times\{1,2,3\}\right)$ and $\left\{\infty_{1}\right\} \cup\left(h_{i} \times\{1,2,3\}\right)(i \geq 2)$.

Then $(P, B)$ is a 5 -fold $K_{4}-e$ design of order $10 k+4$ and $\left\{\infty_{1}\right\} \cup(X \times\{1,2,3\})$ is a 2 -colouring .

Lemma 4.4. There exists a 5-fold $K_{4}-e$ design which can be 2 -coloured of every order $n \geq 4$, except possibly $n=22,23$, and 24 .

Proof: The cases $n \equiv 0$ or $1(\bmod 5)$ are taken care of at the beginning of this section. Since there exists an idempotent cornmutative quasigroup of every odd order and a commutative quasigroup with holes of size 2 of every even order $\geq 6$, the above six constructions produce a 5 -fold $K_{4}-e$ design which can be 2 -coloured of every order $n \equiv 2,3$, or $4(\bmod 5)$, except $4,22,23$, and 24 . The case $n=4$ is trivial, leaving only 22,23 , and 24 .

## 5. The Cases $n=22,23$, and 24 .

In this section we eliminate the three possible exceptions in the statement of Lemma 4.4.

$$
n=\text { 24. Let } T=\{(1,1,1,4),(1,2,3,1),(1,3,4,2),(1,4,2,3),(2,1,4,2),(2,2,2,3) \text {, }
$$

$$
(2,3,1,4),(2,4,3,1),(3,1,2,3),(3,2,4,2),(3,3,3,1),(3,4,1,4),(4,1,3,1),(4,2,1,4)
$$ $(4,3,2,3),(4,4,4,2)\}$. Let $(X, 0)$ be an idempotent anti-symmetric quasigroup of order 6 , set $P=X \times\{1,2,3,4\}$, and define a collection of graphs $B$, as follows:

(1) For each $a \in X$, let $\left(\{a\} \times\{1,2,3,4\}, a^{*}\right)$ be a 5 -fold $K_{4}-e$ design of order 4 and place the 6 graphs belonging to $a^{*}$ in $B$, and
(2) for all $x \neq y \in X$ and $(i, j, s, t) \in T$ place the graph $((x, i),(y, j),(x \circ y, s),(y \circ$ $x, t))$ in $B$. Then $(P, B)$ is a 5 -fold $K_{4}-e$ design and $X \times\{1,2\}$ is a 2 -colouring.
$n=22$. Let $\left(Q, O_{1}\right)$ and $\left(Q, o_{2}\right)$ be the following two quasigroups.

| $\circ_{1}$ | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | 3 | 4 | 5 | 6 | 2 |
| 2 | 4 | 2 | 1 | 6 | 3 | 5 |
| 3 | 5 | 6 | 3 | 1 | 2 | 4 |
| 4 | 6 | 5 | 2 | 4 | 1 | 3 |
| 5 | 2 | 4 | 6 | 3 | 5 | 1 |
| 6 | 3 | 1 | 5 | 2 | 4 | 6 |
|  |  |  |  |  |  |  |

2-colouring $\{1,3,4\}$

| $\circ_{2}$ | 1 | 2 | 3 | 4 | 5 | 6 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | 2 | 4 | 3 | 6 | 5 |
| 2 | 2 | 1 | 5 | 6 | 3 | 4 |
| 3 | 6 | 4 | 3 | 5 | 1 | 2 |
| 4 | 5 | 3 | 6 | 4 | 2 | 1 |
| 5 | 4 | 6 | 2 | 1 | 5 | 3 |
| 6 | 3 | 5 | 1 | 2 | 4 | 6 |

2 -colouring $\{1,3,4\}($ hole $=\{1,2\})$

Let $(X, \circ)$ be an idempotent anti-symmetric quasigroup of order $6, \operatorname{set} P=X \times$ $\{1,2,3,4\}$ and define a collection of graphs $B$ as follows:
(1) Let $a \in X$ and let $\left(\infty_{1}, \infty_{2}\right\} \cup\left(\{a\} \times\{1,2,3,4\}, a^{*}\right)$ be the 5 -fold $K_{4}-e$ design of order 6 defined by $(Q, 0)$ with 2 -colouring $\left\{\infty_{1}\right\} \cup(\{a\} \times\{1,2\})$ and place these graphs in $B$,
(2) for each $b \subset X \backslash\{a\}$, let $\left(\left\{\infty_{1}, \infty_{2}\right\} \cup\left(\{b\} \times\{1,2,3,4\}, b^{*}\right)\right.$ be the 5 -fold $K_{4}-e$ design of order 6 with hole $\left\{\infty_{1}, \infty_{2}\right\}$ defined by $\left(Q, \infty_{2}\right)$ with 2-colouring $\left\{\infty_{1}\right\} \cup$ $(\{b\} \times\{1,2\})$ and place the graphs of $b^{*}$ in $B$, and
(3) the same as (2) in the construction for $n=24$.

Then $(P, B)$ is a 5 -fold $K_{4}-e$ design of order 22 and $\left\{\infty_{1}\right\} \cup(X \times\{1,2\})$ is a 2-colouring.
$n=$ 23. Unfortunately (for technical reasons) the above two constructions cannot be used to construct a 5 -fold $K_{4}-e$ design of order 23 . We content ourselves with an ad hoc example.

\hline
\end{array}
$$

With the above three examples in hand we can now plug the holes in Lemma 4.4.

Lemma 5.1. There exists a 5-fold $K_{4}-e$ design which can be 2-coloured of every order $n \geq 4$.

Theorem 5.2. The spectrum for $\lambda$-fold $K_{4}-e$ designs with $\lambda \equiv 0(\bmod 5)$ which can be 2 -coloured is precisely the set of all $n \geq 4$.

Proof: Write $\lambda=5 k$ and take $k$ copies of Lemma 5.1.

## 6. The main result.

As mentioned in the introduction, the spectrum for $\lambda$-fold $K_{4}-e$ designs is precisely: (i) all $n \equiv 0$ or $1(\bmod 5) \geq 6$ for $\lambda=1$, (ii) all $n \equiv 0$ or $1(\bmod 5)$ for $\lambda \equiv 1,2,3$, or $4(\bmod 5) \geq 2$, and $($ iii $)$ all $n \geq 4$ for $\lambda \equiv 0(\bmod 5)$. Theorems $2.2,3.2$, and 5.2 combine to show that these necessary conditions for the existence of a $\lambda$-fold $K_{4}-e$ design are, in fact, sufficient for the existence of a $\lambda$-fold $K_{4}-e$ design which can be 2-coloured.

Theorem 6.1. The spectrum for $\lambda$-fold $K_{4}-e$ designs which can be 2-coloured is precisely: (i) all $n \equiv 0$ or $1(\bmod 5) \geq 6$ for $\lambda=1$, (ii) all $n \equiv 0$ or $1(\bmod 5)$ for $\lambda \equiv 1,2,3$, or $4(\bmod 5) \geq 2$, and $(i i i)$ all $n \geq 4$ for $\lambda \equiv 0(\bmod 5)$.
